PRODUCTION OF METATHESIS PRODUCTS BY AMORPHOUS POLYMER SEGMENT
INTERCHANGE

CROSS-REFERENCE TO RELATED APPLICATION

5 This application claims the benefit of US Provisional Application Serial No. 60/840,325, filed August 25, 2006.

BACKGROUND OF THE INVENTION

10 In one aspect, the present invention relates to a process for preparing block copolymers by metathesis of two or more polymers containing ethylenic unsaturation. In another aspect, this invention relates to block copolymers prepared by the metathesis process of this invention. Numerous olefin metathesis processes are previously known in the art. In general, olefin metathesis involves catalytic cleavage of one or more olefins at a point of unsaturation and recombination of the resulting cleavage products to form different olefin containing reaction products. Often, low molecular weight olefins and cyclic olefins are employed as reagents in the foregoing reaction
15 mixtures in order to provide low viscosity reaction mixtures, well defined reaction products, reduced polymer product molecular weight, and/or mixtures suitable for reaction injection molding (RIM) compositions. Examples of the foregoing processes are disclosed in USP 5,731,383, 4,994,535, 4,049,616, 3,891,816, 3,692,872, and elsewhere.

20 Metathesis involving polymeric olefins is also known. In Macromol., 33, 1494-1496 (2000), solid polymers were depolymerized by surface contact with a metathesis catalyst. Reaction products of polymer metathesis can include random or block copolymers, functionalized polymers obtained through functionalization of resulting terminal unsaturation, ring opened metathesis products, and even cross-linked solids. Metathesis of two or more olefins is referred to as a "cross-metathesis". Examples of such processes are disclosed by USP's 6,867,274, 6,410,110, 5,603,985,
25 5,559,190, 5,446,102, 4,049,616, and other references. Suitable unsaturated polymers for the foregoing processes include diene homopolymers and copolymers or partially hydrogenated derivatives thereof. Use of cyclic olefins can result in the formation of polymers having narrow molecular weight distributions. For example, preparations of linear polyethylene and poly(ethylidene-norbornene)/polycyclopentene diblock copolymers by ring opening metathesis of
30 polycyclopentene or sequential polymerization of mixtures of ethylidene-norbornene and polycyclopentene were disclosed in Macromol., 33(25), 9215-9221 (2000).

 In USP's 3,692,872, 3,891,816 and 4,010,224 graft and block copolymers and interpolymers were prepared by metathesis of two polymers containing olefinic unsaturation, such as polybutadiene or polyisoprene. Monomers such as cyclooctene or dimers such as
35 cyclooctadiene-cyclopentadiene dimer could be included in the polymerization as well. Similar

processes involving the cross-metathesis of polybutadiene with polycyclooctene or polycyclododecene as well as grafting of EPDM polymers via metathesis were disclosed in DE 2,131,355 and DE 2,242,794. In the former process, "thermoplastic properties were imparted to the elastomer". A summary of the work appeared in J. Mol. Catal., 15, 3-19 (1982).

5 Similarly, in USP's 3,692,872, 3,891,816 and 4,010,224 graft and block copolymers and interpolymers were prepared by metathesis of two polymers containing olefinic unsaturation, such as polybutadiene and polyisoprene. Monomers and dimers such as cyclooctene or cyclooctadiene-cyclopentadiene dimer could be included in the polymerization as well. Exemplified polymer pairs included partially polymerized cements of polycyclooctene and polycyclooctadiene (Ex. I), EPDM/
10 polybutadiene (Ex. II and V), and two EPDM/ cyclooctadiene copolymers having differing cyclooctadiene contents (Ex. III).

In Macromol., 36, 9675-96777 (2003) the ethenolysis of polypropylene/ 1,3-butadiene copolymers to prepare polymers having slightly increased melting temperature for the isotactic polymer segments due to improved packing of shorter chain segments was disclosed. In German
15 Democratic Republic patents DD 146,052 and DD 146,053, 1,4-cis-polybutadiene and copolymers such as ABS rubber or SB rubber were subjected to metathetic depolymerization optionally in the presence of a functionalizing agent, especially an unsaturated carboxylic acid ester. According to USP 7,022,789, the products were polydisperse rubbers indicating the presence of cross-linking due to undesirable quantities of vinyl groups in the product.

20 Disadvantageously, the foregoing known polymeric olefin metathesis products are lacking in desirable physical properties due to the fact that at equilibrium, the individual blocks do not differ significantly from one another in chemical properties. For example, segment properties of polycyclooctene and polycyclododecene or of polybutadiene and polyisoprene, are nearly chemically equivalent. Copolymers comprised of such polymer segments do not possess
25 advantaged properties. Conventional block copolymers, such as those prepared by anionic polymerization techniques readily incorporate dissimilar, immiscible, segments in the same polymer chain. Because the segments possess different physical properties, such as glass transition temperature (T_g), crystalline melting point (T_m), dielectric constant or solubility parameter the resulting polymers possess enhanced properties. For example, the presence of crystalline polymer
30 segments having a relatively high melting point and elastomeric polymer segments within the same polymer chain gives thermoplastic materials having improved elastomeric and mechanical properties, such as high tensile strength, hysteresis, and tear properties.

It would be desirable if there were provided a process for the metathesis of unsaturated polymers that is specifically adapted for the formation of differentiated, commercially valuable
35 copolymer products, having many of the properties of conventional, non-random block copolymers.

It would further be desirable if the resulting polymer products were suitable for use as molding resins, adhesives, sealants, and impact modifiers. Finally, it would be desirable to provide a process for converting readily available, inexpensive, unsaturated polymers into copolymers having differentiated, commercially valuable properties.

5 SUMMARY OF THE INVENTION

According to the present invention there is now provided a process for preparing a cross-metathesized product mixture comprising contacting a metathesis catalyst under metathesis conditions with a composition comprising two or more chemically distinguishable ethylenically unsaturated polymers, at least one of said ethylenically unsaturated polymers (first polymer) having
10 from 0.001 to 50 mole percent unsaturation and at least one other of said ethylenically unsaturated polymers (second polymer) being an amorphous polymer having a Tg less than 0 °C and having from 0.001 to 5 mole percent unsaturation, to thereby form the cross-metathesized reaction product.

In another embodiment of the invention, there is provided the cross-metathesized reaction product formed by contacting a metathesis catalyst under metathesis conditions with a composition
15 comprising two or more ethylenically unsaturated polymers, at least one of said ethylenically unsaturated polymers (first polymer) having from 0.001 to 50 mole percent unsaturation and at least one other of said ethylenically unsaturated polymers (second polymer) being an amorphous polymer having a Tg less than 0 °C and having from 0.001 to 5 mole percent unsaturation.

Suitable unsaturated polymers employed in the present metathesis are polymers prepared by
20 addition polymerization, condensation polymerization, ring opening cycloaddition, or other process or combination of processes capable of forming polymers containing ethylenic unsaturation. At least some of the ethylenic unsaturation in the reagent polymers, preferably most or substantially all of the unsaturation, is located in the main chain or backbone (internal unsaturation). Such internal ethylenic unsaturation desirably results in formation of segments in at least one of the unsaturated
25 polymer reagents that are of sufficient length so as to possess an expected Tg or measured Tm of less than 0 °C (alternatively referred to here-in-after as "soft segments"). Both the reagent polymer and the resulting cross-metathesized polymer product possess said soft segments.

Desirably, the ethylenic content of the second unsaturated polymer reagent is from 0.001 to less than 3 mole percent, more preferably from 0.01 to 2 mole percent, even more preferably from
30 0.1 to 1.0 mole percent. Conversely, the ethylenic content of the first unsaturated polymer reagent is desirably at least 10 mole percent, more preferably at least 15 mole percent, and even more preferably at least 20 mole percent. In certain desirable embodiments, the ethylenic carbon content of the unsaturated polymer reagents is less than or equal to 40 weight percent, preferably less than or equal to 35 weight percent. The quantity of ethylenic unsaturation in the polymer reagents may
35 be adjusted prior to metathesis by partial hydrogenation, in order to attain the desired polymer

segment lengths. Further desirably, the second reagent polymer is formed by copolymerization of ethylene or propylene with small quantities of a diene monomer or an alkyne, especially a conjugated diene, and one or more copolymerizable comonomers, especially one or more α -olefin comonomers. Moreover, the distribution of diene monomer in this reagent polymer is substantially random. More preferably, at least 99 percent of multiple unsaturations remaining in the polymer, especially at least 99.9 percent thereof, are separated by at least 4 methylene or substituted methylene units, most preferably at least 6 such units. Highly preferably, the second unsaturated polymer reagent is formed by an addition polymerization process, especially a coordination polymerization process.

Preferably, the second unsaturated polymer reagent contains segments having lengths of greater than 10 atoms, more preferably at least 20, and most preferably at least 40 carbon atoms. It will be appreciated by the skilled artisan that by using unsaturated polymer reagents with higher unsaturation content, shorter polymer blocks in the resulting polymeric product result. Desirably, the soft segment containing polymers have Tg of less than -25 °C, even more preferably less than -40 °C.

Examples of unsaturated soft segment containing polymers for use as reagents or components of the reaction mixture herein include random copolymers of ethylene with one or more C₃₋₂₀ olefin monomers and one or more diolefins; random copolymers of ethylene with one or more C₃₋₂₀ olefin monomers and one or more alkynes; random copolymers of ethylene with one or more C₃₋₂₀ olefin monomers, one or more diolefins, and one or more alkynes; condensation polymers formed by condensation of two or more condensable monomers at least one of which comprises ethylenic unsaturation; free radically polymerized homopolymers and copolymers of at least one conjugated diene and a copolymerizable comonomer, partially hydrogenated derivatives of the foregoing, and partially hydrogenated conjugated diene homopolymers, so long as the polymers possess the previously identified unsaturation content and Tg value.

Most preferred second polymer reagents are substantially random copolymers of ethylene with propylene, 1-butene, 1-hexene, or 1-octene and one or more conjugated dienes, containing up to 5 percent, preferably up to 3 mole percent, more preferably up to 1 mole percent polymerized diene, and partially hydrogenated derivatives thereof. Preferred conjugated dienes are especially butadiene, isoprene, 2-chloro-1,3-butadiene, and 2-fluoro-1,3-butadiene. Examples include copolymers of ethylene, propylene, and one or more of butadiene, isoprene, 2-chloro-1,3-butadiene, or 2-fluoro-1,3-butadiene, copolymers of ethylene, 1-hexene and one or more of butadiene, isoprene, 2-chloro-1,3-butadiene, or 2-fluoro-1,3-butadiene; or copolymers of ethylene, 1-octene, and one or more of butadiene, isoprene, 2-chloro-1,3-butadiene, or 2-fluoro-1,3-butadiene. Because techniques for hydrogenation of polymers are relatively expensive and inconvenient due to the fact

that the polymer normally needs to be dissolved or liquefied, preferred reagent polymers are those possessing limited quantities of polymerized diene and not hydrogenated derivatives of diene homopolymers or copolymers. Such copolymers uniquely and desirably possess inherently low vinyl contents, leading to highly linear cross-metathesized reaction products.

5 Any remaining unsaturated polymer reagent(s) (in addition to the first and second polymers) employed in the cross-metathesis may be of the foregoing types, or an ethylenically unsaturated polymer having an expected T_g or measured T_m value greater than 100°C (hard segment containing polymer) or a homopolymer or copolymer of one or more dienes, especially polymers of one or more conjugated dienes, prepared by free radical polymerization techniques.
10 Preferred polymers include polybutadiene, polyisoprene, poly(2-chloro-1,3-butadiene), acrylonitrile/butadiene copolymers, and poly(2-fluoro-1,3-butadiene).

In one embodiment of the invention, at least one of the unsaturated polymer reagents is incompatible with at least one other unsaturated polymer reagent and the resulting cross-metathesized product is compatibilized due to formation of a quantity of the present cross-metathesized product. Examples of unsaturated polymers that commonly are incompatible with one
15 another include polar group containing polymers and non-polar polymers. Evidence of improved compatibility of compositions according to the invention include decreased crystallite size, improved clarity, increased impact strength, improved ductility, and/or increased tensile properties of the resulting cross-metathesized polymer product compared to the initial polymer mixture before
20 undergoing metathesis.

The preparation, especially in the melt, of a compatibilized product mixture according to the foregoing embodiment of the invention is often expedited by addition to the initially incompatible polymers of a small quantity of preformed cross-metathesized copolymer, prepared by solution techniques, by copolymerization of representative monomers, or obtained from previous operation
25 of the present invention. This initial "seed" of previously formed compatibilizer can substantially reduce the time required to achieve formation of a homogeneous cross-metathesized product. Additionally, an olefin, especially ethylene, can be employed to reduce the viscosity of the reaction mixture, especially in the initial stages of the process. It can be removed at later stages of the reaction by heating the reaction mixture in the absence of added olefin but in the presence of the
30 metathesis catalyst, optionally under reduced pressure. Stoichiometric amounts of added olefin, such as a cyclic olefin or ethylene, can also be used to adjust the molecular weight of the resulting cross-metathesized product mixture.

Additional desirable embodiments of the present invention include cross-metathesis processes wherein at least one of the reagent polymers is (are) amorphous having from 0.001 to 5
35 mole percent unsaturation and one other reagent polymer is (are) crystallizable, also having from

0.001 to 5 mole percent unsaturation. Preferably the difference between expected T_g for the amorphous polymer and the measured T_m for the crystallizable polymer is at least 40 °C, more preferably at least 80 °C, and most preferably at least 100 °C. Highly desirably, T_m for the crystallizable polymer is higher than the expected T_g for the amorphous polymer. Even more preferably, the crystallizable polymer and/or the segments thereof have a crystalline melting point (T_m) of at least 100 °C, highly preferably at least 105 °C, and most preferably at least 120 °C. Further desirably, the heat of fusion associated with the melting point of the crystalline polymer or segments thereof is at least 20 J/g, preferably at least 40 J/g, more preferably at least 50 J/g, as determined by DSC analysis. Included are polymers in which crystallinity is induced or enhanced by the use of nucleating agents, thermal annealing, and/or strain.

With respect to all of the foregoing polymers or polymeric compositions constituting embodiments of the invention, processes for forming the same and methods of using them as molding resins, adhesives, and components of blended compositions are also included within the present invention.

In the embodiments of the invention wherein the second polymer containing soft segments is formed by polymerization of ethylene, one or more C₃₋₂₀ α-olefins, and a conjugated diene or alkyne, such polymer is inherently low in pendant vinyl functional groups, thereby obviating the need for hydrogenation to reduce the level of unsaturation. The resulting metathesis products inherently possess high α,ω-unsaturation and are highly linear. Through selection of appropriate coordination catalysts and reaction conditions, the pendant vinyl functionality in such amorphous copolymers may be reduced to as low as 5 percent or less, even 2 percent or less, and even 1 percent or less of the total ethylenic groups, and with hydrogenation, even lower. The resulting metathesis products and functionalized derivatives thereof accordingly have a significantly reduced proclivity to form cross-links or pendant branches. Desirably, functionalities from 1.9 to 2.5, preferably from 2.0 to 2.2 are attainable.

In addition, because the diene remnant in the soft segment containing copolymer reagents is not necessarily employed for purposes of imparting elastomeric properties to the resulting product, and desirably isn't so employed, a wide variety of polymer properties and combinations of properties can be introduced into the resulting products. Especially preferred cross-metathesis products are formed by metathesis of polybutadiene or poly(2-chloro-1,3-butadiene) with ethylene/1-octene/ diene copolymers comprising no more than 5, preferably no more than 3, more preferably no more than 2, and most preferably no more than 1 mole percent butadiene, isoprene, or 2-chloro-1,3-butadiene.

The products are usefully employed in the manufacture of adhesives, as molding resins and adhesive films for multi-layer laminations such as bags, pouches and laminated feed stock and as compatibilizers used in the formation of blends of polyethylene or other olefin polymers.

DETAILED DESCRIPTION OF THE INVENTION

All references to the Periodic Table of the Elements herein shall refer to the Periodic Table of the Elements, published and copyrighted by CRC Press, Inc., 2003. Also, any references to a
25 Group or Groups shall be to the Group or Groups reflected in this Periodic Table of the Elements using the IUPAC system for numbering groups disclosed in, Nomenclature of Inorganic Chemistry: Recommendations 1990, G. J. Leigh, Editor, Blackwell Scientific Publications (1990). Unless stated to the contrary, implicit from the context, or customary in the art, all parts and percents are based on weight. For purposes of United States patent practice, the contents of any
30 patent, patent application, or publication referenced herein are hereby incorporated by reference in their entirety (or the equivalent US version thereof is so incorporated by reference) especially with respect to the disclosure of synthetic techniques, definitions (to the extent not inconsistent with any definitions provided herein) and general knowledge in the art.

35 The term "comprising" and derivatives thereof is not intended to exclude the presence of any additional component, step or procedure, whether or not the same is disclosed herein. In order

to avoid any doubt, all compositions claimed herein through use of the term "comprising" may include any additional additive, adjuvant, or compound whether polymeric or otherwise, unless stated to the contrary. In contrast, the term, "consisting essentially of" excludes from the scope of any succeeding recitation any other component, step or procedure, excepting those that are not essential to operability. The term "consisting of" excludes any component, step or procedure not specifically delineated or listed. The term "or", unless stated otherwise, refers to the listed members individually as well as in any combination.

As used herein with respect to a chemical compound, unless specifically indicated otherwise, the singular includes all isomeric forms and vice versa (for example, "hexane", includes all isomers of hexane individually or collectively). The terms "compound" and "complex" are used interchangeably herein to refer to organic-, inorganic- and organometal compounds. The term, "atom" refers to the smallest constituent of an element regardless of ionic state, that is, whether or not the same bears a charge or partial charge or is bonded to another atom. The term "heteroatom" refers to an atom other than carbon or hydrogen. Preferred heteroatoms include: F, Cl, Br, N, O, P, B, S, Si, Sb, Al, Sn, As, Se and Ge.

The term, "hydrocarbyl" refers to univalent substituents containing only hydrogen and carbon atoms, including branched or unbranched, saturated or unsaturated, cyclic, polycyclic or noncyclic species. Examples include alkyl-, cycloalkyl-, alkenyl-, alkadienyl-, cycloalkenyl-, cycloalkadienyl-, aryl-, and alkynyl- groups. "Substituted hydrocarbyl" refers to a hydrocarbyl group that is substituted with one or more nonhydrocarbyl substituent groups. The term "heterocarbyl" refers to groups containing one or more carbon atoms and one or more heteroatoms and no hydrogen atoms. The bond between the carbon atom and any heteroatom as well as the bonds between any two heteroatoms, may be a single or multiple covalent bond or a coordinating or other donative bond. Examples include trichloromethyl-, perfluorophenyl-, cyano- and isocyanato- groups. The terms "heteroatom containing hydrocarbyl" or "heterohydrocarbyl" refer to univalent groups in which at least one atom other than hydrogen or carbon is present along with one or more carbon atoms and one or more hydrogen atoms. Thus, an alkyl group substituted with a halo-, heterocycloalkyl-, aryl- substituted heterocycloalkyl-, heteroaryl-, alkyl- substituted heteroaryl-, alkoxy-, aryloxy-, dihydrocarbylboryl-, dihydrocarbylphosphino-, dihydrocarbylamino-, trihydrocarbylsilyl-, hydrocarbylthio-, or hydrocarbylseleno- group is within the scope of the term heterohydrocarbyl. Examples of suitable heteroalkyl groups include chloromethyl-, 2-cyanoethyl-, hydroxymethyl-, benzoylmethyl-, (2-pyridyl)methyl-, chlorobenzyl-, and trifluoromethyl- groups.

As used herein the term "aromatic" refers to a polyatomic, cyclic, conjugated ring system containing $(4\delta+2)$ π -electrons, wherein δ is an integer greater than or equal to 1. The term "fused" as used herein with respect to a ring system containing two or more polyatomic, cyclic rings means

that with respect to at least two rings thereof, at least one pair of adjacent atoms is included in both rings. The term "aryl" refers to a monovalent aromatic substituent which may be a single aromatic ring or multiple aromatic rings which are fused together, linked covalently, or linked to a common group such as a methylene or ethylene moiety. Examples of aromatic ring(s) include phenyl, naphthyl, anthracenyl, and biphenyl, among others.

"Substituted aryl" refers to an aryl group in which one or more hydrogen atoms bound to any carbon is replaced by one or more functional groups such as alkyl, alkenyl, substituted alkyl, substituted alkenyl, cycloalkyl, substituted cycloalkyl, heterocycloalkyl, substituted heterocycloalkyl, halo, haloalkyl (for example, CF_3), hydroxy, amino, phosphido, alkoxy, amino, thio, nitro, and both saturated and unsaturated hydrocarbylene groups, including those which are fused to the aromatic ring(s), linked covalently or linked to a common group such as a methylene or ethylene moiety. The common linking group may also be carbonyl as in benzophenone-, oxygen as in diphenylether- or nitrogen as in diphenylamine- groups.

"Ethylenic unsaturation" or "ethylenic group" refers to adjacent aliphatic carbon atoms bound together by double bonds (non-aromatic sp^2 electronic hybridization), preferably of the formula: $-\text{CR}^*=\text{CR}^*-$, or $-\text{CR}^*=\text{CR}^*_2$, where R^* independently each occurrence is hydrogen, halo, nitrile, hydrocarbyl, or substituted hydrocarbyl containing up to 20 atoms not counting hydrogen. Percent ethylenic unsaturation as used herein is calculated based on total carbon-carbon bond content of the polymer. The term "ethylenic carbon content" refers to the percent of total polymer weight due to such double bonded carbon atoms. For purposes of clarity, the ethylenic carbon contents of perfectly unsaturated polybutadiene, polyisoprene and poly(2-chloro-1,3-butadiene) polymers are 42, 34 and 26 weight percent respectively. The term "pendant" refers to groups or substituents attached to secondary or tertiary substituted carbons of the polymer. The term "terminal" refers to groups or substituents attached to a primary carbon of the polymer.

The term "polymer" as used herein refers to a macromolecular compound comprising multiple repeating units and a molecular weight of at least 100, preferably at least 1000. Preferably, at least one repeating unit occurs, consecutively or non-consecutively, 6 or more times, more preferably 10 or more times, and most preferably 20 or more times on average. Molecules containing less than 6 such repeating units on average are referred to herein as oligomers. The term includes homopolymers, copolymers, terpolymers, interpolymers, and so on. The term "interpolymer" is used herein interchangeably with the term copolymer to refer to polymers incorporating in polymerized form at least two differentiated repeating units, usually obtained from separate copolymerizable monomers. The least prevalent monomer in the resulting copolymer or interpolymer is generally referred to by the term "comonomer".

The term, "segment(s)" refers to portions of an unsaturated polymer having a uniform composition and a carbon chain length of at least 12 carbons, preferably at least 20 carbons, more preferably at least 30 carbons, separated by ethylenic unsaturations or, in the case of a polymer comprising a single terminal unsaturation, terminated by the ethylenic unsaturation. Unsaturation occurring within a cyclic moiety, such as an alicyclic or aromatic group does not result in segment formation. Desirably, the segments in the present copolymers are substantially free of internal rings or cyclic moieties. The term "uniform composition" as used herein refers to segments that are derived from the same (co)monomer stream(s), the sequence and stereo-regularity in each segment being governed by the relative reactivity of each (co)monomer. Accordingly, the monomer sequence and stereo-regularity in any two or more segments may range from being essentially identical to being substantially different and any degree of variation in between these two extremes.

The term "block copolymer" refers to a polymer having two or more distinguishable, non-pendant polymer sections (blocks). Desirably, block copolymers exhibit the properties of thermoplastic elastomers (TPE) characterized by the presence of "soft" or elastomeric blocks connecting "hard" either crystallizable or glassy blocks in the same polymer. At temperatures up to the melt temperature or glass transition temperature of the hard segments, the polymers demonstrate elastomeric character. At temperatures higher than the crystalline melting point of the hard segments, the polymers become flowable, exhibiting thermoplastic behavior.

The term "unsaturated block copolymer" refers to a block copolymer that comprises ethylenic unsaturation either between blocks or within one or more blocks thereof. An unsaturated polymer or an unsaturated block within a block copolymer may comprise one or more segments. The term "amorphous" refers to a polymer, polymer block or polymer segment (collectively referred to here-in-after as polymeric entities) lacking a crystalline melting point. The term "crystalline" refers to a polymeric entity possessing a crystalline melting point. The term "semi-crystalline" refers to a polymeric entity possessing a crystalline melting point which is lower than that of a fully crystalline or more fully crystalline polymer entity of the same chemical composition. More specifically, semi-crystalline as used herein, refers to polymer entities possessing crystallinity that is less than 90 percent of the maximum attainable crystallinity for that polymer entity. For the avoidance of doubt, the term crystalline includes semi-crystalline polymer entities.

The term "backbone" refers to the longest continuous polymeric chain of a polymer. All other polymer chains are referred to as side chains, branches, or grafted polymer chains. Short chains or short chain branching refers to branches from the backbone resulting from polymerization of monomers containing three or more carbons. Polymerization of such monomers containing two or more ethylenic unsaturations can result in the formation of unsaturated branches (pendant unsaturation) in the resulting polymer. Metathesis of polymers containing such unsaturated

branches can result in formation of "comb" type block copolymers, that is, polymers having multiple polymer chains pendant from a central backbone chain. Alternatively, the resulting polymer product may be cross-linked.

As used herein, the term "chemically distinguishable" refers to polymeric entities
5 containing an identifiable chemical property or characteristic that allows the polymer, block or segment to be distinguished from another polymer, block or segment. Specifically excluded are polymeric entities differing from one another only by molecular weight or molecular weight distribution such as products that may be formed upon metathesis of a single unsaturated polymer. Examples of chemically distinguishable polymeric entities include those differing in composition,
10 tacticity, density, crystallinity, crystallite size, crystalline melt point, glass transition temperature, dielectric constant, solubility parameter, interaction parameter (χ). The foregoing values may be either expected or actually measured. The presence of chemically distinguishable polymer entities is readily determined by standard analytic techniques, such as identifiable melt point, by NMR techniques, IR analysis for polar group containing polymers, CRYSTAF, ATREF, TREF, or by
15 other methods. Preferred, chemically distinguishable polymer blocks in the present meta-block copolymers are those characterized by a difference in crystalline melting point, polarity (χ), tacticity (rrr or mmm triad), expected glass transition temperature (T_g), interaction parameter (χ), or expected solubility parameter.

The chemical properties of a polymer segment herein may be determined by ethenolysis of
20 the unsaturated polymer according to known procedures, and analysis of the residual segment properties by standard analytical techniques. Separation of differing segments by elutriation, chromatography, or other fractionation technique may be necessary prior to analysis.

Identification of monomer and comonomer, comonomer amount, unsaturation levels, branching and tacticity in polymeric entities in the present polymer reagents and products may be
25 accomplished using NMR techniques such as those disclosed in, NMR and Macromolecules: sequence, dynamic and domain structure, James C. Randall, ed.; ACS Symposium Series, 247; American Chemical Society, Washington, D.C. (1984) (here-in-after, Randall).

Polymer properties herein may be characterized by actual values, that is, measured or calculated values based on samples or expected properties. The term "expected" when used in
30 reference to the properties of polymer entities are those properties predicted by the method of infinite molecular weight, room temperature (25 °C), atactic, polymer calculation disclosed in Jozef Bicerano, Prediction of Polymer Properties, 2nd ed., Marcel Dekker, Inc., New York (here-in-after, Bicerano). The technique is also incorporated into software, including SYNTHIA™, available from Molecular Simulations Inc., a subsidiary of Pharmacoepia, Inc. The expected properties of

certain representative polymers calculated according to the Bicerano technique are shown in Table 1.

Table 1 Calculated Expected Polymer Properties

Polymer	Repeat Unit Formula	Refractive Index (n)	Dielectric Constant (ϵ)	Glass Transition, T _g (°C)	Solubility Parameter $\delta_2 ((J/cc)^{1/2})$
polyethylene	CH ₂	1.4648	2.33	-86	16.8
polypropylene	C ₃ H ₆	1.4713	2.26	-38	16.1
poly(1-butene)	C ₄ H ₈		2.28	-57	16.3
poly(1-hexene)	C ₆ H ₁₂	1.466	2.30	-77	16.5
poly(1-octene)	C ₈ H ₁₆	1.466	2.31	-86	16.6
polyisobutylene	C ₄ H ₈	1.4795	2.22	-83	15.4
polystyrene	C ₈ H ₈	1.6037	2.57	106	19.5
polychloroprene	C ₄ H ₅ Cl	1.5673		-36	19.5
poly(1,2-butadiene)	C ₄ H ₆	1.5055		13	16.8
poly(1,4-butadiene)	C ₄ H ₆	1.5188	2.32	-99	17.7
polyisoprene	C ₅ H ₈	1.5159	2.28	-72	17.2
polycyclooctene (ROMP)*	C ₈ H ₁₄	1.4918	2.32	-90	17.3
polycyclodecene (ROMP)*	C ₁₀ H ₁₈	1.4864	2.32	-88	17.2
polycyclododecene (ROMP)*	C ₁₂ H ₂₂	1.4828	2.32	-87	17.1
poly(methyl methacrylate)	C ₅ H ₇ O ₂	1.4846	3.07	84	17.7
poly(acrylonitrile)	C ₃ H ₃ N	1.5425	3.99	91	24.6
poly(vinyl chloride)	C ₂ H ₃ Cl	1.5560	2.93	20	19.4
poly(vinylidene chloride)	C ₂ H ₂ Cl ₂	1.6080	2.86		21.0
bisphenol-A polycarbonate	C ₁₀ H ₁₄ O ₃	1.5870	2.90	146	19.3
poly(ethylene terephthalate)	C ₁₀ H ₈ O ₄	1.5558	3.28	100	19.8
poly(ϵ -caprolactam)	C ₆ H ₁₁ ON	1.5130	3.47	57	25.1
poly(ϵ -caprolactone)	C ₆ H ₁₀ O ₂	1.475	2.91	-44	17.8
polyoxyethylene	C ₂ H ₄ O	1.4648	2.77	-68	19.1
polyoxymethylene	CH ₂ O	1.465	3.11	-60	20.6

* ROMP means ring opening metathesis polymerization

The term "elastomeric" refers to polymeric entities having T_g less than 25 °C, preferably less than 0 °C, and elastic recovery of at least 90 percent when tested according to ASTM D-1708 at 21 °C. Crystalline melting point (T_m) refers to the peak melting point determined by DSC according to ASTM D-3418 test method.

The unsaturated amorphous polymer reagents are desirably prepared by addition polymerization of ethylene, one or more C₃₋₈ α -olefin comonomers and a diene, suitably employing a Ziegler/Natta, metallocene, post-metallocene, or other coordination polymerization catalyst, suitable processes for preparation of which are disclosed in more detail here-in-after. By the term "Ziegler/Natta polymerization catalyst" is meant a catalyst composition suited for polymerization of olefins comprising an organometallic compound in which the metal is from groups 2, 12 or 13 of the Periodic Table of the Elements in combination with at least one other compound, especially a

halide, oxide or oxyhalide, of a metal selected from groups 4, 5 or 6 of the Periodic Table of the Elements.

Due to the relative low unsaturation content of the present soft segment containing copolymer reagents, the segments participating in the present cross-metathesis desirably have a segment length, or SL, expressed as the average number of monomeric repeating units, from 20 to 1000, preferably from 40 to 100, which corresponds to copolymers containing from about 0.1 to 5 mole percent polymerized diene, preferably from 1 to 2.5 mole percent diene. Further desirably, the soft segments present in the resulting metathesis product are amorphous.

In a preferred embodiment, one unsaturated polymeric reagent is a copolymer of butadiene ethylene and 1-octene, containing from 2 to 10 mole percent 1-octene or a copolymer of butadiene, propylene and ethylene, containing from 2 to 65 mole percent ethylene, thereby forming aliphatic polymer segments that are amorphous. The other polymeric reagent desirably is polybutadiene, polyisoprene, poly(2-chloro-1,3-butadiene), or poly(2-fluoro-1,3-butadiene). The resulting cross-metathesized polymer product comprises random combinations of soft segments from both polymer reagents in the same polymer, thereby producing a compatibilized blend of the two polymers. For the purposes of this invention, the term "random" refers to a property or outcome that follows and/or arises from no describable deterministic pattern. Metathesis processes are random, in that which ethylenic bonds in an unsaturated polymer cleave and how the resulting molecular fragments recombine to form new ethylenic bonds are not predictable and do not follow predetermined rules. It is noted that such processes lead to compositions having a random distribution of polymer segments, and consequentially, a random distribution of polymer blocks.

The amount of ethylenic unsaturation in the reagent polymers can be determined by any suitable technique, such as iodine monochloride titration (ICl), NMR analysis or other technique. When appropriate, a combination of these techniques can be used. ICl titration is a well known technique for determining the level of carbon-carbon unsaturation in a wide variety of polymers wherein iodine monochloride is used to react with any unsaturations present in the polymer. The method does not distinguish between internal and terminal or vinyl unsaturation.

NMR spectroscopic analysis has particular utility for use with homopolymers and copolymers of conjugated dienes, due to the fact that the amount of internal unsaturation in the polymers (resulting from 1,4-addition of the diene) as opposed to vinyl unsaturation (resulting from 1,2-addition of the diene) may be determined using this technique. NMR techniques of polymer analysis include especially those of Randall.

Preferred combinations of unsaturated polymer reagents for use herein are those containing one or more amorphous segments, especially segments that are highly branched ethylene/ 1-octene

copolymers, and at least one other unsaturated polymer selected from polybutadiene or poly(2-chloro-1,3-butadiene). Highly desirably, only two unsaturated polymers are employed.

Suitable unsaturated polymers for use herein preferably contain non-terminal ethylenic unsaturation in the polymer backbone or in one or more branches thereof. Terminal or vinyl unsaturation may also be present, without departing from the scope of the present invention, so long as some non-terminal unsaturation is present in at least one of the unsaturated polymer reagents. Ethylenic unsaturation is provided by the diene, especially butadiene, present in an amount to provide, after polymerization, the desired level of non-terminal ethylenic unsaturation(s) per molecule.

Additional suitable polymers include those containing functionality, including hydroxyl, acid, especially carboxylic acid, ester, especially carboxylic acid ester, amine, halide, nitrile, anhydride, or thiol functionality. Generally, the presence of polar functional groups such as the foregoing, may require the use of metathesis catalysts that are stable and unaffected. Suitable catalysts include homogeneous ruthenium catalysts including first-generation Grubbs catalysts, exemplified by bis(tricyclohexylphosphine)-benzylidene ruthenium dichloride, and second-generation Grubbs catalysts, exemplified by tricyclohexylphosphine[1,3-bis(2,4,6-trimethylphenyl)-4,5-dihydroimidazol-2-ylidene][benzylidene]ruthenium dichloride. "First-generation and second-generation Grubbs catalysts," named for their principle inventor Robert H. Grubbs, are disclosed in WO 96/04289, WO 02/083742, and elsewhere. First-generation and second-generation Grubbs catalysts tend to be relatively tolerant towards air, moisture, and a wide array of polar functional groups, such as acid and ester functionalities.

The unsaturated reagent polymers may be readily prepared using standard polymerization techniques, such as by polymerizing an olefin mixture comprising one or more olefins in combination with at least one conjugated or non-conjugated diene using free radical-, addition-, ring opening-, anionic-, cationic-, condensation, or metathesis polymerization techniques. The method by which the unsaturated reagent polymer is produced may affect the resulting metathesis product. For example, larger length blocks will generally result where at least one of the reagent polymers is a simple diblock or triblock copolymer prepared, for example, by anionic polymerization of an olefin and a conjugated diene. More detailed description of the various methods of preparing the unsaturated polymer reagents follows.

A. FREE RADICAL POLYMERIZATION

Free-radical polymerization of comonomers is amenable to use with large numbers of comonomers to produce a wide variety of unsaturated polymers containing amorphous or soft blocks. Free-radical polymerization is also compatible with polar and non-polar monomers, and the resulting polymers may be subjected to grafting with additional functionalized polymer segments.

The final polymer may be hydrogenated to reduce the level of unsaturation and/or eliminate terminal unsaturation, if desired. Suitable techniques include free-radical copolymerization of one or more copolymerizable monomers with a diene and/or an ethynyl compound, such as an acetylene derivative, and optionally grafting, to form linear or branched polymers with pendant and/or backbone unsaturations as well as polymerization under free radical polymerization conditions of one or more monomers and optionally grafting, further optionally involving treatment at high temperatures, dehydrogenation, dehalohydrogenation or other procedure to increase unsaturation.

Monomers suitable for use in free radical polymerization include practically any ethylenically unsaturated monomer. Examples of suitable monomers and details regarding such processes are found in "Polymer Handbook", 4th Ed, Brandrup, Immergut, and Grulke, Eds., Wiley, 1999; and "Copolymerization", G. E. Ham, Ed., High Polymers, Vol. XVIII, Interscience, 1964.

Preferred monomers suitably polymerized by free radical polymerization techniques include aliphatic and aromatic α -olefins and substituted olefins, conjugated and non-conjugated dienes, and cyclic olefins and polyolefins. Examples include: ethylene, propylene, 1-butene, 1-hexene, 1-octene, 4-methyl-1-pentene, acrylonitrile, methylmethacrylate, butylacrylate, styrene, vinylcyclohexane, α -methylstyrene, p-vinyltoluene, vinyl chloride, vinylidene chloride, vinylidene fluoride, tetrafluoroethylene, 1,3-butadiene, isoprene, 2,3-dimethyl-1,3-butadiene, 1,3-pentadiene, 1,3-hexadiene, 1,4-hexadiene, 1,5-hexadiene, 2,4-hexadiene, 2-methyl-3-ethyl-1,3-butadiene, 3-methyl-1,3-pentadiene, 2-methyl-3-ethyl-1,3-pentadiene, 2-ethyl-1,3-pentadiene, 3-methyl-1,3-heptadiene, 3-octadiene, 3-butyl-1,3-octadiene, 3,4-dimethyl-1,3-hexadiene, 3-n-propyl-1,3-pentadiene, 4,5-diethyl-1,3-octadiene, 2-phenyl-1,3-butadiene, 2,3-diethyl-1,3-butadiene, 2,3-di-n-propyl-1,3-butadiene, 2-methyl-3-isopropyl-1,3-butadiene, 2-chloro-1,3-butadiene, 2-fluoro-1,3-butadiene, 2-methoxy-1,3-butadiene, 2-ethoxy-3-ethyl-1,3-butadiene, 2-ethoxy-3-methyl-1,3-hexadiene, decadiene, divinylbenzene, cyclohexene, vinylcyclohexene, benzocyclobutene, norbornene, norbornadiene, dicyclopentadiene, ethylidene norbornene and mixtures thereof.

B. ADDITION POLYMERIZATION

Addition polymerization processes, such as transition metal catalyzed polymerizations more fully disclosed here-in-after, are compatible with a large number of monomers, normally excluding unprotected polar group containing monomers. Certain monomers can yield crystalline polymers with high melting points or polymers with very low glass transition temperatures. Polymers made by polymerizing one or more addition polymerizable monomers along with a diene, preferably a conjugated alkadiene, especially 1,4-butadiene, and/or an alkyne compound, especially an acetylene derivative, form branched or linear polymers with pendant and/or backbone unsaturation(s). Additionally, chain end unsaturation may result due to beta-hydride elimination and/or a small quantity of backbone unsaturation(s) may result from a random spontaneous dehydrogenation

during the polymerization process. Parent unsaturated polymers made by addition polymerization processes can be partially hydrogenated to limit the amount of ethylenic unsaturation to the aforementioned preferred range and/or control the type of unsaturation, for example, by preferentially hydrogenating terminal and/or pendant unsaturation.

5 A partial list of monomers suitably polymerized by addition polymerization techniques includes aliphatic and aromatic α -olefins and substituted olefins, conjugated and non-conjugated dienes, and cyclic olefins and polyolefins. Examples include: ethylene, propylene, 1-butene, 1-hexene, 1-octene, 4-methyl-1-pentene, acrylonitrile, methylmethacrylate, butylacrylate, styrene, vinylcyclohexane, α -methylstyrene, p-vinyltoluene, 1,3-butadiene, isoprene, 2,3-dimethyl-1,3-
10 butadiene, 1,3-pentadiene, 1,3-hexadiene, 1,4-hexadiene, 1,5-hexadiene, 2,4-hexadiene, 2-methyl-3-ethyl-1,3-butadiene, 3-methyl-1,3-pentadiene, 2-methyl-3-ethyl-1,3-pentadiene, 2-ethyl-1,3-pentadiene, 3-methyl-1,3-heptadiene, 3-octadiene, 3-butyl-1,3-octadiene, 3,4-dimethyl-1,3-hexadiene, 3-n-propyl-1,3-pentadiene, 4,5-diethyl-1,3-octadiene, 2-phenyl-1,3-butadiene, 2,3-diethyl-1,3-butadiene, 2,3-di-n-propyl-1,3-butadiene, 2-methyl-3-isopropyl-1,3-butadiene, 2-chloro-
15 1,3-butadiene, 2-fluoro-1,3-butadiene, 2-methoxy-1,3-butadiene, 2-ethoxy-3-ethyl-1,3-butadiene, 2-ethoxy-3-methyl-1,3-hexadiene, decadiene, divinylbenzene, cyclohexene, vinylcyclohexene, benzocyclo-butene, norbornene, norbornadiene, dicyclopentadiene, ethylidene norbornene, and mixtures thereof.

C. ANIONIC POLYMERIZATION

20 Anionic polymerization is often very useful in making block copolymers containing ethylenic unsaturation, such as by consecutive monomer addition schemes or coupling processes. Conjugated dienes or multifunctional monomers are used to introduce backbone and/or pendant unsaturation in the polymers. Polymers, especially, those containing butadiene or isoprene, may be partially hydrogenated to control the amount and type of unsaturation. Suitable monomers for
25 polymerization under anionic polymerization conditions include:

ethylene, styrene, α -methylstyrene, and p-vinyltoluene,
conjugated dienes such as 1,3-butadiene, isoprene, 2,3-dimethyl-1,3-butadiene, 1,3-pentadiene, 1,5-hexadiene, 2,4-hexadiene, 1,3-hexadiene, 2-methyl-3-ethyl-1,3-butadiene, 3-methyl-1,3-pentadiene, 2-methyl-3-ethyl-1,3-pentadiene, 2-ethyl-1,3-pentadiene, 3-methyl-1,3-heptadiene,
30 3-octadiene, 3-butyl-1,3-octadiene, 3,4-dimethyl-1,3-hexadiene, 3-n-propyl-1,3-pentadiene, 4,5-diethyl-1,3-octadiene, 2-phenyl-1,3-butadiene, 2,3-diethyl-1,3-butadiene, 2,3-di-n-propyl-1,3-butadiene, 2-methyl-3-isopropyl-1,3-butadiene,
divinylbenzene and divinyltoluene,
methylmethacrylate, cyanoacrylate, and butylacrylate,
35 acrylonitrile.

D. RING OPENING POLYMERIZATION

Ring-opening polymerizations can result in polymers and copolymers with backbone or pendant unsaturation if functional comonomers are employed. Unsaturation can also be incorporated into the polymer through the choice of initiating group, such as unsaturated alcohols.

5 A partial list of suitable compounds subject to ring opening polymerization includes:

ethylene oxide, propylene oxide, tetrahydrofuran, and trioxane,
lactams, such as caprolactam,
cyclic thioethers,
epichlorohydrin and derivatives thereof,
10 oxepans and oxetanes,
lactones,
lactides,
cyclic anhydrides, and
cyclic amines.

E. METATHESIS POLYMERIZATION

Metathesis of unsaturated monomers or monomer mixtures can be used to produce one or all unsaturated polymers for use according to the present invention. Such polymers and copolymers naturally contain ethylenic unsaturation along the polymer backbone. Additional pendant double bonds can be introduced through use of multifunctional monomers. A partial list of suitable
20 monomers for use in such a metathesis polymerization includes:

acyclic dienes, such as 1,3-butadiene, isoprene, 2,3-dimethyl-1,3-butadiene, 1,3-pentadiene, 1,5-hexadiene, 2,4-hexadiene, 1,3-hexadiene, 2-methyl-3-ethyl-1,3-butadiene, 3-methyl-1,3-pentadiene, 2-methyl-3-ethyl-1,3-pentadiene, 2-ethyl-1,3-pentadiene, 3-methyl-1,3-heptadiene, 3-octadiene, 3-butyl-1,3-octadiene, 3,4-dimethyl-1,3-hexadiene, 3-n-propyl-1,3-pentadiene, 4,5-diethyl-1,3-octadiene, 2-phenyl-1,3-butadiene, 2,3-diethyl-1,3-butadiene, 2,3-di-n-propyl-1,3-butadiene, 2-methyl-3-isopropyl-1,3-butadiene, 2-chloro-1,3-butadiene, 2-fluoro-1,3-butadiene, 2-methoxy-1,3-butadiene, 2-ethoxy-3-ethyl-1,3-butadiene, and 2-ethoxy-3-methyl-1,3-hexadiene,
cyclic olefins such as cyclopentene, cyclohexene, and cyclooctene,
cyclic dienes such as cyclopentadiene, dicyclopentadiene, ethylidene norbornene,
30 norbornene, norbornadiene, and cyclooctadiene.

F. CONDENSATION OR STEP-GROWTH POLYMERIZATION

Condensation polymers and copolymers may be produced using co-monomers having pendant or backbone unsaturation thereby preparing unsaturated polymers suitable for use as one or all of the unsaturated polymer reagents of the present metathesis process. In addition, polymers
35 containing ester functionality may be exposed to transesterification with molecules containing

backbone or pendant unsaturation to produce unsaturated polymers suitable for use in the present process. Examples of compounds suitable for use in such transesterification processes (and the present invention) include: polyesters, polyanhydrides, polyacetals, polyacrylamide, polyamides, polyurethanes, polyureas, silk fibroin, cellulose, phenol-formaldehyde resins, urea-formaldehyde resins, polysulfides, polysiloxanes, polycarbonates, polyethers, polyimides, polyimines, polysaccharides, and proteins. Preferred condensation or step-growth polymers for use in the present invention include ethylenically unsaturated polyamides, polycarbonates, polyurethanes and polyethers.

It is to be understood that while all of the foregoing processes for preparing unsaturated polymers suitable for use in the present process provided that the previously disclosed requirements regarding ethylenic unsaturation content and Tg between polymer pairs are observed. Most preferred unsaturated soft segment containing polymers for use in the present invention are polyolefinic hydrocarbons of relatively uniform composition, having polydispersity from about 1.8 to 5.0, prepared by addition polymerization, especially coordination polymerization, of ethylene, one or more C₃₋₂₀ aliphatic α -olefins, and a conjugated diene, especially butadiene, isoprene or 2-chloro-1,3-butadiene.

Metathesis Process Description

Suitable metathesis conditions for use herein include sequential or simultaneous contacting of one or more metathesis catalysts with the respective unsaturated polymer reagents. The metathesis may take place in the liquid phase, such as by use of solvents or in melts of one or more polymers, or in a solid state process, and does not require that polymers be completely miscible or soluble at all times during the process. The unsaturated polymer reagents can be synthesized in parallel or series with the present metathesis in one or more bulk, solution, slurry, suspension, gas phase, or other polymerization reactors, either as one unit operation of the present process or separately. In one embodiment, the parent polymers for the present metathesis are coproduced prior to metathesis, and subjected to the present process prior to recovery or isolation, thereby avoiding the need for remelting, dissolution and/or blending of the unsaturated polymer reagents. Highly desirably, the temperature and reaction medium are chosen so that at least one component of the reaction mixture is molten or sufficiently solubilized to provide a fluid reaction medium.

The molecular weight of the resulting polymer products may range from as low as 250 g/mole, and as high as 1×10^7 g/mole. The polydispersity (Mw/Mn) is dependent on the polydispersity and functionality of the parent polymers. Suitable ranges of Mw/Mn for the resulting polymer products are from close to 1.0 to 100, and preferably are from 1.8 to 10.

Since the product of the present process is a random distribution of polymer segments, the product may comprise a portion of unattached polymer segments. The fraction of unattached

segments may be characterized by any suitable analytical technique, such as TREF or ATREF. In general, the quantity of unattached segments ranges from 2 to 98 percent, preferably from 2 to 5 percent. The fraction of unattached sequences may be varied depending on the nature of the unsaturated polymer reagents and the intended end use of the resulting polymer product.

5 Metathesis Products

The copolymer products of the invention comprise a random distribution of polymer blocks and block lengths. The length distribution of the blocks is dependent on the length distribution of the segments in the initial polymer reagents and the extent of metathesis conducted. The polymers of the invention are distinguished from pure diblock, triblock, or other copolymers due to the
10 presence of random polymer block connectivity and a statistical distribution of block lengths. If more than two polymer types are present and/or pendant chain unsaturations are present initially or generated during the metathesis process, additional polymer types, such as comb polymers will be present in the resulting product.

Linear polymers result when linear unsaturated polymers having one or more backbone
15 unsaturations are metathesized. Branching in polymer products results when unsaturated polymers having a combination of backbone unsaturation and pendant unsaturation, including unsaturated long-chain branches, are metathesized. Comb polymers are formed when one or more unsaturated parent polymers has predominantly pendant unsaturation and at least one other unsaturated parent polymer has predominantly backbone unsaturation. For the special case where one unsaturated
20 parent polymer contains predominantly pendant vinyl functionality, a crosslinked network may result, giving polymers including lightly cross-linked or fully vulcanized products. Terminal, unsaturation, on the other hand, has no net effect on the present process and simply generates a relatively long terminal block in the resulting product. Preferably most or substantially all of the ethylenic unsaturation in the reagent polymers is non-terminating unsaturation.

25 Specific non-limiting polymer products obtainable according to the present invention include those resulting from metathesis of the following combination or unsaturated reagent polymers. In all cases the value T_m or T_g may be actual or expected.

A. Unsaturated Branched Polyethylene + Unsaturated Diene Rubber

1. The cross-metathesized product preferably is comprised of segments of amorphous
30 polyethylene (soft segments) having an associated T_{g1} and segments of an elastomeric diene polymer (soft segments) having a associated T_{g2} or short chain non-polymeric segments, especially if highly unsaturated diene polymers are used (unsaturation levels in the diene polymer of 10-50, preferably 10-48, mole percent). Use of polar group containing diene elastomers, especially 2-chloro-1,3-butadiene, 2-fluoro-1,3-butadiene, or acrylonitrile/1,3-butadiene copolymers, gives
35 elastomer products having improved compatibility with polyolefins such as polyethylene.

2. The mass fraction of branched polyethylene segments in the polymer product, desirably varies from 4 to 96 percent. The mass fraction of unattached low density polyethylene desirably is less than 50 percent, preferably less than or equal to 25 percent.

In the foregoing embodiments:

5 T_{g1} preferably is greater than T_{g2} , more preferably at least 25 °C greater than T_{g2} , and most preferably at least 50 °C greater than T_{g2} .

B. Unsaturated Polypropylene/Ethylene Copolymer + Unsaturated Diene Rubber

1. The cross-metathesized product preferably is comprised of propylene/ethylene copolymer segments having an associated T_{g1} and segments of an elastomeric diene polymer having an associated T_{g2} or short chain non-polymeric segments, especially if highly unsaturated diene polymers are used (unsaturation levels in the diene polymer of 10-50, preferably 10-48, mole percent). Use of polar group containing diene elastomers, especially 2-chloro-1,3-butadiene, 2-fluoro-1,3-butadiene, or acrylonitrile/1,3-butadiene copolymers, gives elastomer products having improved compatibility with polyolefins such as polypropylene.

15 2. The polymer can optionally contain crystalline or semi-crystalline polypropylene segments with associated crystalline melting point or T_m .

3. The mass fraction of propylene/ethylene elastomer segments desirably is from 4 to 96 percent. Further desirably, the mass fraction of unattached polypropylene is less than 50 percent, preferably less than or equal to 25 percent.

20 In the foregoing embodiments:

T_m is greater than 100 °C, more preferably greater than 130 °C, and most preferably greater than 150 °C;

T_{g1} preferably is greater than T_{g2} , more preferably at least 25 °C greater than T_{g2} , and most preferably at least 50 °C greater than T_{g2} .

25 C. Unsaturated Polar Group Containing Amorphous Polymer + Unsaturated Diene Rubber

1. The cross-metathesized product preferably is comprised of segments of polar group containing amorphous polymer having an associated T_{g1} and segments of an elastomeric diene polymer having an associated T_{g2} or short chain non-polymeric segments, especially if highly unsaturated diene polymers are used (unsaturation of 10-50, preferably 10-48, mole percent).

30 2. The mass fraction of polar group containing amorphous polymer in the product desirably varies from 4 to 96 percent. The mass fraction of unattached polar group containing polymer desirably is less than 50 percent, preferably less than or equal to 25 percent.

In the foregoing embodiments:

35 T_{g1} preferably is greater than T_{g2} , more preferably at least 25 °C greater than T_{g2} , and most preferably at least 50 °C greater than T_{g2} .

D. Unsaturated Polar Group Containing Amorphous Polymer + Unsaturated Polar Group Containing Diene Elastomer

1. The cross-metathesized product preferably is comprised of segments of polar group containing amorphous polymer having an associated T_{g1} and segments of an elastomeric polar group containing diene polymer (soft segments) having an associated T_{g2} or short chain non-polymeric segments, especially if highly unsaturated diene polymers are used (unsaturation of 10-50, preferably 10-48, mole percent). Use of poly(2-chloro-1,3-butadiene), poly(2-fluoro-1,3-butadiene), or acrylonitrile/1,3-butadiene copolymers, are preferred for forming polar group substituted diene polymers.

2. The mass fraction of polar group containing amorphous polymer segments in the copolymer product desirably varies from 4 to 96 percent. The mass fraction of unattached polar group containing amorphous polymer segments desirably is less than 50 percent, preferably less than or equal to 25 percent.

In the foregoing embodiments:

T_{g1} preferably is greater than T_{g2} , more preferably at least 25 °C greater than T_{g2} , and most preferably at least 50 °C greater than T_{g2} .

Identification of the various polymer segments is conducted by use of CRYSTAF, TREF, ATREF, DSC, IR or NMR techniques, or combinations thereof.

Unsaturated Reagent Polymer Synthesis by Addition Polymerization

A preferred process for preparing unsaturated hard segment reagent polymers for use herein is the addition polymerization of ethylene, one or more α -olefins and a diolefin. Suitable catalysts for such copolymerization include the well known transition metal based coordination catalysts previously disclosed for use in polymerizations of olefin monomers. Especially preferred catalysts comprise a Group 4 metal, especially zirconium or hafnium, and a heteroatom containing donor ligand. Desirable catalysts produce interpolymer products that are low in terminal unsaturation. The presence of unsaturation in the polymer, especially terminal unsaturation, may be further reduced by hydrogenation of the resulting interpolymer prior to contact with the metathesis catalyst. Desirably, the incidence of olefinic unsaturation in the unsaturated polymer is adjusted to between 0.01 and 0.1 percent, with the terminal unsaturation being not more than 0.001 percent, preferably less than 0.0001 percent. In determining such values, the ethylene units and any substituents on either carbon thereof are included in the theoretical weights of the ethylenic unit.

Examples of suitable Group 4 metal complexes useful as coordination catalyst components include complexes of transition metals selected from Groups 3 to 15 of the Periodic Table of the Elements containing one or more delocalized, π -bonded ligands or polyvalent Lewis base ligands. Examples include metallocene, half-metallocene, constrained geometry, and polyvalent

pyridylamine-, polyether-, or other polychelating base complexes. The complexes are generically depicted by the formula: $MK_kX_xZ_z$, or a dimer thereof, wherein

M is a metal selected from Groups 3-15, preferably 3-10, more preferably 4-8, and most preferably Group 4 of the Periodic Table of the Elements;

5 K independently each occurrence is a group containing delocalized π -electrons or one or more electron pairs through which K is bound to M, said K group containing up to 50 atoms not counting hydrogen atoms, optionally two or more K groups may be joined together forming a bridged structure, and further optionally one or more K groups may be bound to Z, to X or to both Z and X;

10 X independently each occurrence is a monovalent, anionic moiety having up to 40 non-hydrogen atoms, optionally one or more X groups may be bonded together thereby forming a divalent or polyvalent anionic group, and, further optionally, one or more X groups and one or more Z groups may be bonded together thereby forming a moiety that is both covalently bound to M and coordinated thereto;

15 Z independently each occurrence is a neutral, Lewis base donor ligand of up to 50 non-hydrogen atoms containing at least one unshared electron pair through which Z is coordinated to M;

k is an integer from 0 to 3;

x is an integer from 1 to 4;

z is a number from 0 to 3; and

20 the sum, $k+x$, is equal to the formal oxidation state of M.

Suitable metal complexes include those containing from 1 to 3 π -bonded anionic or neutral ligand groups, which may be cyclic or non-cyclic delocalized π -bonded anionic ligand groups. Exemplary of such π -bonded groups are conjugated or nonconjugated, cyclic or non-cyclic diene and dienyl groups, allyl groups, boratabenzene groups, phosphole, and arene groups. By the term
25 " π -bonded" is meant that the ligand group is bonded to the transition metal by a sharing of electrons from a partially delocalized π -bond.

Each atom in the delocalized π -bonded group may independently be substituted with a radical selected from the group consisting of hydrogen, halogen, hydrocarbyl, halohydrocarbyl, hydrocarbyl-substituted heteroatoms wherein the heteroatom is selected from Group 14-16 of the
30 Periodic Table of the Elements, and such hydrocarbyl-substituted heteroatom radicals further substituted with a Group 15 or 16 hetero atom containing moiety. In addition two or more such radicals may together form a fused ring system, including partially or fully hydrogenated fused ring systems, or they may form a metallocycle with the metal. Included within the term "hydrocarbyl" are C_{1-20} straight, branched and cyclic alkyl radicals, C_{6-20} aromatic radicals, C_{7-20} alkyl-substituted
35 aromatic radicals, and C_{7-20} aryl-substituted alkyl radicals. Suitable hydrocarbyl-substituted

heteroatom radicals include mono-, di- and tri-substituted radicals of boron, silicon, germanium, nitrogen, phosphorus or oxygen wherein each of the hydrocarbyl groups contains from 1 to 20 carbon atoms. Examples include N,N-dimethylamino, pyrrolidinyl, trimethylsilyl, trimethylsilyl, t-butyltrimethylsilyl, methyldi(t-butyl)silyl, triphenylgermyl, and trimethylgermyl groups. Examples of Group 15 or 16 hetero atom containing moieties include amino, phosphino, alkoxy, or alkylthio moieties or divalent derivatives thereof, for example, amide, phosphide, alkyleneoxy or alkylene thio groups bonded to the transition metal or Lanthanide metal, and bonded to the hydrocarbyl group, π -bonded group, or hydrocarbyl- substituted heteroatom.

Examples of suitable anionic, delocalized π -bonded groups include cyclopentadienyl, indenyl, fluorenyl, tetrahydroindenyl, tetrahydrofluorenyl, octahydrofluorenyl, pentadienyl, cyclohexadienyl, dihydroanthracenyl, hexahydroanthracenyl, decahydroanthracenyl groups, phosphole, and boratabenzyl groups, as well as inertly substituted derivatives thereof, especially C_{1-10} hydrocarbyl- substituted or tris(C_{1-10} hydrocarbyl)silyl- substituted derivatives thereof. Preferred anionic delocalized π -bonded groups are cyclopentadienyl, pentamethylcyclopentadienyl, tetramethylcyclopentadienyl, tetramethylsilylcyclopentadienyl, indenyl, 2,3-dimethylindenyl, fluorenyl, 2-methylindenyl, 2-methyl-4-phenylindenyl, tetrahydrofluorenyl, octahydrofluorenyl, 1-indacenyl, 3-pyrrolidinoinden-1-yl, 3,4-(cyclopenta(*h*))phenanthren-1-yl, and tetrahydroindenyl.

The boratabenzenyl ligands are anionic ligands which are boron containing analogues to benzene. They are previously known in the art having been described by G. Herberich, et al., in Organometallics, 14,1, 471-480 (1995). Preferred boratabenzenyl ligands correspond to the formula:

wherein R^1 is an inert substituent, preferably selected from the group consisting of hydrogen, hydrocarbyl, silyl, halo or germlyl, said R^1 having up to 20 atoms not counting hydrogen, and optionally two adjacent R^1 groups may be joined together. In complexes involving divalent derivatives of such delocalized π -bonded groups one atom thereof is bonded by means of a covalent bond or a covalently bonded divalent group to another atom of the complex thereby forming a bridged system.

Phospholes are anionic ligands that are phosphorus containing analogues to a cyclopentadienyl group. They are previously known in the art having been described by WO 98/50392, and elsewhere. Preferred phosphole ligands correspond to the formula:

wherein R¹ is as previously defined.

Preferred transition metal complexes for use herein correspond to the formula: MK_kX_xZ_z, or a dimer thereof, wherein:

5 M is a Group 4 metal;

K is a group containing delocalized π -electrons through which K is bound to M, said K group containing up to 50 atoms not counting hydrogen atoms, optionally two K groups may be joined together forming a bridged structure, and further optionally one K may be bound to X or Z;

10 X each occurrence is a monovalent, anionic moiety having up to 40 non-hydrogen atoms, optionally one or more X and one or more K groups are bonded together to form a metallocycle, and further optionally one or more X and one or more Z groups are bonded together thereby forming a moiety that is both covalently bound to M and coordinated thereto;

Z independently each occurrence is a neutral, Lewis base donor ligand of up to 50 non-hydrogen atoms containing at least one unshared electron pair through which Z is coordinated to M;

15 k is an integer from 0 to 3;

x is an integer from 1 to 4;

z is a number from 0 to 3; and

the sum, k+x, is equal to the formal oxidation state of M.

Preferred complexes include those containing either one or two K groups. The latter
20 complexes include those containing a bridging group linking the two K groups. Preferred bridging groups are those corresponding to the formula (ER'₂)_e, wherein E is silicon, germanium, tin, or carbon, R' independently each occurrence is hydrogen or a group selected from silyl, hydrocarbyl, hydrocarbyloxy and combinations thereof, said R' having up to 30 carbon or silicon atoms, and e is 1 to 8. Preferably, R' independently each occurrence is methyl, ethyl, propyl, benzyl, tert-butyl,
25 phenyl, methoxy, ethoxy or phenoxy.

Examples of the complexes containing two K groups are compounds corresponding to the formula:

wherein:

M is titanium, zirconium or hafnium, preferably zirconium or hafnium, in the +2 or +4 formal oxidation state;

5 R^3 in each occurrence independently is selected from the group consisting of hydrogen, hydrocarbyl, silyl, germyl, cyano, halo and combinations thereof, said R^3 having up to 20 non-hydrogen atoms, or adjacent R^3 groups together form a divalent derivative (that is, a hydrocarbadiyl, siladiyl or germadiyl group) thereby forming a fused ring system, and

10 X'' independently each occurrence is an anionic ligand group of up to 40 non-hydrogen atoms, or two X'' groups together form a divalent anionic ligand group of up to 40 non-hydrogen atoms or together are a conjugated diene having from 4 to 30 non-hydrogen atoms bound by means of delocalized π -electrons to M, whereupon M is in the +2 formal oxidation state, and

R' , E and e are as previously defined.

Exemplary bridged ligands containing two π -bonded groups are:

15 dimethylbis(cyclopentadienyl)silane, dimethylbis(tetramethylcyclopentadienyl)silane, dimethylbis(2-ethylcyclopentadien-1-yl)silane, dimethylbis(2-t-butylcyclopentadien-1-yl)silane, 2,2-bis(tetramethylcyclopentadienyl)propane, dimethylbis(inden-1-yl)silane, dimethylbis(tetrahydroinden-1-yl)silane, dimethylbis(flouren-1-yl)silane, dimethylbis(tetrahydrofluoren-1-yl)silane, dimethylbis(2-methyl-4-phenylinden-1-yl)-silane, 20 dimethylbis(2-methylinden-1-yl)silane, dimethyl(cyclopentadienyl)(fluoren-1-yl)silane, dimethyl(cyclopentadienyl)(octahydrofluoren-1-yl)silane, dimethyl(cyclopentadienyl)(tetrahydrofluoren-1-yl)silane, (1, 1, 2, 2-tetramethy)-1, 2-bis(cyclopentadienyl)disilane, (1, 2-bis(cyclopentadienyl)ethane, and dimethyl(cyclopentadienyl)-1-(fluoren-1-yl)methane.

25 Preferred X'' groups are selected from hydride, hydrocarbyl, silyl, germyl, halohydrocarbyl, halosilyl, silylhydrocarbyl and aminohydrocarbyl groups, or two X'' groups together form a divalent derivative of a conjugated diene or else together they form a neutral, π -bonded, conjugated diene. Most preferred X'' groups are C_{1-20} hydrocarbyl groups.

Examples of metal complexes of the foregoing formula suitable for use in the present invention include:

- bis(cyclopentadienyl)zirconiumdimethyl,
- bis(cyclopentadienyl)zirconium dibenzyl,
- 5 bis(cyclopentadienyl)zirconium methyl benzyl,
- bis(cyclopentadienyl)zirconium methyl phenyl,
- bis(cyclopentadienyl)zirconiumdiphenyl,
- bis(cyclopentadienyl)titanium-allyl,
- bis(cyclopentadienyl)zirconiummethylmethoxide,
- 10 bis(cyclopentadienyl)zirconiummethylchloride,
- bis(pentamethylcyclopentadienyl)zirconiumdimethyl,
- bis(pentamethylcyclopentadienyl)titaniumdimethyl,
- bis(indenyl)zirconiumdimethyl,
- indenylfluorenyl zirconiumdimethyl,
- 15 bis(indenyl)zirconiummethyl(2-(dimethylamino)benzyl),
- bis(indenyl)zirconiummethyltrimethylsilyl,
- bis(tetrahydroindenyl)zirconiummethyltrimethylsilyl,
- bis(pentamethylcyclopentadienyl)zirconiummethylbenzyl,
- bis(pentamethylcyclopentadienyl)zirconiumdibenzyl,
- 20 bis(pentamethylcyclopentadienyl)zirconiummethylmethoxide,
- bis(pentamethylcyclopentadienyl)zirconiummethylchloride,
- bis(methylethylcyclopentadienyl)zirconiumdimethyl,
- bis(butylcyclopentadienyl)zirconiumdibenzyl,
- bis(t-butylcyclopentadienyl)zirconiumdimethyl,
- 25 bis(ethyltetramethylcyclopentadienyl)zirconiumdimethyl,
- bis(methylpropylcyclopentadienyl)zirconiumdibenzyl,
- bis(trimethylsilylcyclopentadienyl)zirconiumdibenzyl,
- dimethylsilylbis(cyclopentadienyl)zirconiumdichloride,
- dimethylsilylbis(cyclopentadienyl)zirconiumdimethyl,
- 30 dimethylsilylbis(tetramethylcyclopentadienyl)titanium (III) allyl
- dimethylsilylbis(t-butylcyclopentadienyl)zirconiumdichloride,
- dimethylsilylbis(n-butylcyclopentadienyl)zirconiumdichloride,
- (dimethylsilylbis(tetramethylcyclopentadienyl)titanium(III) 2-(dimethylamino)benzyl,
- (dimethylsilylbis(n-butylcyclopentadienyl)titanium(III) 2-(dimethylamino)benzyl,
- 35 dimethylsilylbis(indenyl)zirconiumdichloride,

dimethylsilylbis(indenyl)zirconiumdimethyl,
 dimethylsilylbis(2-methylindenyl)zirconiumdimethyl,
 dimethylsilylbis(2-methyl-4-phenylindenyl)zirconiumdimethyl,
 dimethylsilylbis(2-methylindenyl)zirconium-1,4-diphenyl-1,3-butadiene,
 5 dimethylsilylbis(2-methyl-4-phenylindenyl)zirconium (II) 1,4-diphenyl-1,3-butadiene,
 dimethylsilylbis(4,5,6,7-tetrahydroinden-1-yl)zirconiumdichloride,
 dimethylsilylbis(4,5,6,7-tetrahydroinden-1-yl)zirconiumdimethyl,
 dimethylsilylbis(tetrahydroindenyl)zirconium(II) 1,4-diphenyl-1,3-butadiene,
 dimethylsilylbis(tetramethylcyclopentadienyl)zirconium dimethyl
 10 dimethylsilylbis(fluorenyl)zirconiumdimethyl,
 dimethylsilylbis(tetrahydrofluorenyl)zirconium bis(trimethylsilyl),
 ethylenebis(indenyl)zirconiumdichloride,
 ethylenebis(indenyl)zirconiumdimethyl,
 ethylenebis(4,5,6,7-tetrahydroindenyl)zirconiumdichloride,
 15 ethylenebis(4,5,6,7-tetrahydroindenyl)zirconiumdimethyl,
 (isopropylidene)(cyclopentadienyl)(fluorenyl)zirconiumdibenzyl, and
 dimethylsilyl(tetramethylcyclopentadienyl)(fluorenyl)zirconium dimethyl.

A further class of metal complexes utilized in the present invention corresponds to the
 preceding formula: MKZ_zX_x , or a dimer thereof, wherein M, K, X, x and z are as previously
 20 defined, and Z is a substituent of up to 50 non-hydrogen atoms that together with K forms a
 metallocycle with M.

Preferred Z substituents include groups containing up to 30 non-hydrogen atoms comprising
 at least one atom that is oxygen, sulfur, boron or a member of Group 14 of the Periodic Table of the
 Elements directly attached to K, and a different atom, selected from the group consisting of
 25 nitrogen, phosphorus, oxygen or sulfur that is covalently bonded to M.

More specifically this class of Group 4 metal complexes used according to the present
 invention includes "constrained geometry catalysts" corresponding to the formula:

wherein:

30 M is titanium or zirconium, preferably titanium in the +2, +3, or +4 formal oxidation state;
 K¹ is a delocalized, π -bonded ligand group optionally substituted with from 1 to 5 R²
 groups,

R^2 in each occurrence independently is selected from the group consisting of hydrogen, hydrocarbyl, silyl, germyl, cyano, halo and combinations thereof, said R^2 having up to 20 non-hydrogen atoms, or adjacent R^2 groups together form a divalent derivative (that is, a hydrocarbadiyl, siladiyl or germadiyl group) thereby forming a fused ring system,

each X is a halo, hydrocarbyl, hydrocarbyloxy or silyl group, said group having up to 20 non-hydrogen atoms, or two X groups together form a neutral C_{5-30} conjugated diene or a divalent derivative thereof;

x is 1 or 2;

Y is -O-, -S-, -NR'-, -PR'-; and

X' is SiR'^2 , CR'^2 , $SiR'^2SiR'^2$, $CR'^2CR'^2$, $CR'=CR'$, $CR'^2SiR'^2$, or GeR'^2 , wherein

R' independently each occurrence is hydrogen or a group selected from silyl, hydrocarbyl, hydrocarbyloxy and combinations thereof, said R' having up to 30 carbon or silicon atoms.

Specific examples of the foregoing constrained geometry metal complexes include compounds corresponding to the formula:

wherein,

Ar is an aryl group of from 6 to 30 atoms not counting hydrogen;

R^4 independently each occurrence is hydrogen, Ar, or a group other than Ar selected from hydrocarbyl, trihydrocarbylsilyl, trihydrocarbylgermyl, halide, hydrocarbyloxy,

trihydrocarbylsiloxy, bis(trihydrocarbylsilyl)amino, di(hydrocarbyl)amino, hydrocarbadiylamino, hydrocarbylimino, di(hydrocarbyl)phosphino, hydrocarbadiylphosphino, hydrocarbylsulfido, halo-substituted hydrocarbyl, hydrocarbyloxy- substituted hydrocarbyl, trihydrocarbylsilyl- substituted hydrocarbyl, trihydrocarbylsiloxy- substituted hydrocarbyl, bis(trihydrocarbylsilyl)amino-substituted hydrocarbyl, di(hydrocarbyl)amino- substituted hydrocarbyl, hydrocarbyleneamino-substituted hydrocarbyl, di(hydrocarbyl)phosphino- substituted hydrocarbyl,

hydrocarbylenephosphino- substituted hydrocarbyl, or hydrocarbylsulfido- substituted hydrocarbyl, said R group having up to 40 atoms not counting hydrogen atoms, and optionally two adjacent R^4 groups may be joined together forming a polycyclic fused ring group;

M is titanium;

X' is SiR^6 , CR^6 , SiR^6SiR^6 , CR^6CR^6 , $CR^6=CR^6$, CR^6SiR^6 , BR^6 , BR^6L'' , or GeR^6 ;

Y is -O-, -S-, -NR⁵-, -PR⁵-; -NR⁵, or -PR⁵;

R^5 , independently each occurrence, is hydrocarbyl, trihydrocarbylsilyl, or trihydrocarbylsilylhydrocarbyl, said R^5 having up to 20 atoms other than hydrogen, and optionally two R^5 groups or R^5 together with Y or Z form a ring system;

R^6 , independently each occurrence, is hydrogen, or a member selected from hydrocarbyl, hydrocarbyloxy, silyl, halogenated alkyl, halogenated aryl, $-NR^5_2$, and combinations thereof, said R^6 having up to 20 non-hydrogen atoms, and optionally, two R^6 groups or R^6 together with Z forms a ring system;

Z is a neutral diene or a monodentate or polydentate Lewis base optionally bonded to R^5 , R^6 , or X;

X is hydrogen, a monovalent anionic ligand group having up to 60 atoms not counting hydrogen, or two X groups are joined together thereby forming a divalent ligand group;

x is 1 or 2; and

z is 0, 1 or 2.

Preferred examples of the foregoing metal complexes are substituted at both the 3- and 4-positions of a cyclopentadienyl or indenyl group with an Ar group.

Examples of the foregoing metal complexes include:

(3-phenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (3-phenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-phenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,3-diphenyl-1,3-butadiene;
 (3-(pyrrol-1-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (3-(pyrrol-1-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-(pyrrol-1-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-diphenyl-1,3-butadiene;
 (3-(1-methylpyrrol-3-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (3-(1-methylpyrrol-3-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-(1-methylpyrrol-3-yl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-diphenyl-1,3-butadiene;
 (3,4-diphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (3,4-diphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3,4-diphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,3-pentadiene;
 (3-(3-N,N-dimethylamino)phenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (3-(3-N,N-dimethylamino)phenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium

- dimethyl,
 (3-(3-N,N-dimethylamino)phenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 (II) 1,4-diphenyl-1,3-butadiene;
 (3-(4-methoxyphenyl)-4-methylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 5 dichloride,
 (3-(4-methoxyphenyl)-4-phenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-(4-methoxyphenyl)-4-phenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II)
 1,4-diphenyl-1,3-butadiene;
 (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 10 (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-
 diphenyl-1,3-butadiene;
 (3-phenyl-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 dichloride,
 15 (3-phenyl-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 dimethyl,
 (3-phenyl-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 (II) 1,4-diphenyl-1,3-butadiene;
 2-methyl-(3,4-di(4-methylphenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 20 dichloride,
 2-methyl-(3,4-di(4-methylphenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 dimethyl,
 2-methyl-(3,4-di(4-methylphenyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium
 (II) 1,4-diphenyl-1,3-butadiene;
 25 ((2,3-diphenyl)-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-butylamido)silane
 titanium dichloride,
 ((2,3-diphenyl)-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-butylamido)silane
 titanium dimethyl,
 ((2,3-diphenyl)-4-(N,N-dimethylamino)cyclopentadien-1-yl)dimethyl(t-
 30 butylamido)silanetitanium (II) 1,4-diphenyl-1,3-butadiene;
 (2,3,4-triphenyl-5-methylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (2,3,4-triphenyl-5-methylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (2,3,4-triphenyl-5-methylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-
 diphenyl-1,3-butadiene;
 35 (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,

- (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (3-phenyl-4-methoxycyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-
 diphenyl-1,3-butadiene;
 (2,3-diphenyl-4-(n-butyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 5 (2,3-diphenyl-4-(n-butyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl,
 (2,3-diphenyl-4-(n-butyl)cyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-
 diphenyl-1,3-butadiene;
 (2,3,4,5-tetraphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dichloride,
 (2,3,4,5-tetraphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium dimethyl, and
 10 (2,3,4,5-tetraphenylcyclopentadien-1-yl)dimethyl(t-butylamido)silanetitanium (II) 1,4-
 diphenyl-1,3-butadiene.

Additional examples of suitable metal complexes for use as addition polymerization catalysts are polycyclic complexes corresponding to the formula:

- 15 where M is titanium in the +2, +3 or +4 formal oxidation state;
 R⁷ independently each occurrence is hydride, hydrocarbyl, silyl, germyl, halide,
 hydrocarbyloxy, hydrocarbylsiloxy, hydrocarbylsilylamino, di(hydrocarbyl)amino,
 hydrocarbyleneamino, di(hydrocarbyl)phosphino, hydrocarbylene-phosphino, hydrocarbylsulfido,
 halo-substituted hydrocarbyl, hydrocarbyloxy-substituted hydrocarbyl, silyl-substituted
 20 hydrocarbyl, hydrocarbylsiloxy-substituted hydrocarbyl, hydrocarbylsilylamino-substituted
 hydrocarbyl, di(hydrocarbyl)amino-substituted hydrocarbyl, hydrocarbyleneamino-substituted
 hydrocarbyl, di(hydrocarbyl)phosphino-substituted hydrocarbyl, hydrocarbylene-phosphino-
 substituted hydrocarbyl, or hydrocarbylsulfido-substituted hydrocarbyl, said R⁷ group having up to
 40 atoms not counting hydrogen, and optionally two or more of the foregoing groups may together
 25 form a divalent derivative;
 R⁸ is a divalent hydrocarbylene- or substituted hydrocarbylene group forming a fused
 system with the remainder of the metal complex, said R⁸ containing from 1 to 30 atoms not
 counting hydrogen;
 X^a is a divalent moiety, or a moiety comprising one σ-bond and a neutral two electron pair
 30 able to form a coordinate-covalent bond to M, said X^a comprising boron, or a member of Group 14
 of the Periodic Table of the Elements, and also comprising nitrogen, phosphorus, sulfur or oxygen;

X is a monovalent anionic ligand group having up to 60 atoms exclusive of the class of ligands that are cyclic, delocalized, π -bound ligand groups and optionally two X groups together form a divalent ligand group;

Z independently each occurrence is a neutral ligating compound having up to 20 atoms;

5 x is 0, 1 or 2; and

z is zero or 1.

Preferred examples of such complexes are 3-phenyl-substituted *s*-indecenyl complexes corresponding to the formula:

10 2,3-dimethyl-substituted *s*-indecenyl complexes corresponding to the formulas:

or 2-methyl-substituted *s*-indecenyl complexes corresponding to the formulas:

Additional examples of such metal complexes include those of the formula:

Specific metal complexes include:

- 5 (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (II) 1,4-diphenyl-1,3-butadiene,
- (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (II) 1,3-pentadiene,
- (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide
- 10 titanium (III) 2-(N,N-dimethylamino)benzyl,
- (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dichloride,
- (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dimethyl,
- 15 (8-methylene-1,8-dihydrodibenzo[*e,h*]azulen-1-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dibenzyl,

 30 (8-difluoromethylene-1,8-dihydrodibenzo[*e,h*]azulen-2-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dichloride,
 (8-difluoromethylene-1,8-dihydrodibenzo[*e,h*]azulen-2-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dimethyl,

(8-difluoromethylene-1,8-dihydrodibenzo[*e,h*]azulen-2-yl)-N-(1,1-dimethylethyl)dimethylsilanamide titanium (IV) dibenzyl, and mixtures thereof, especially mixtures of positional isomers.

Further illustrative examples of metal complexes for use in addition polymerization processes correspond to the formula:

where M is titanium in the +2, +3 or +4 formal oxidation state;

T is -NR⁹- or -O-;

R⁹ is hydrocarbyl, silyl, germyl, dihydrocarbylboryl, or halohydrocarbyl or up to 10 atoms not counting hydrogen;

R¹⁰ independently each occurrence is hydrogen, hydrocarbyl, trihydrocarbylsilyl, trihydrocarbylsilylhydrocarbyl, germyl, halide, hydrocarbyloxy, hydrocarbylsiloxy, hydrocarbylsilylamino, di(hydrocarbyl)amino, hydrocarbyleneamino, di(hydrocarbyl)phosphino, hydrocarbylene-phosphino, hydrocarbylsulfido, halo- substituted hydrocarbyl, hydrocarbyloxy-substituted hydrocarbyl, silyl- substituted hydrocarbyl, hydrocarbylsiloxy- substituted hydrocarbyl, hydrocarbylsilylamino- substituted hydrocarbyl, di(hydrocarbyl)amino- substituted hydrocarbyl, hydrocarbyleneamino-substituted hydrocarbyl, di(hydrocarbyl)phosphino- substituted hydrocarbyl, hydrocarbylenephosphino- substituted hydrocarbyl, or hydrocarbylsulfido- substituted hydrocarbyl, said R¹⁰ group having up to 40 atoms not counting hydrogen atoms, and optionally two or more of the foregoing adjacent R¹⁰ groups may together form a divalent derivative thereby forming a saturated or unsaturated fused ring;

X^a is a divalent moiety lacking in delocalized π -electrons, or such a moiety comprising one σ -bond and a neutral two electron pair able to form a coordinate-covalent bond to M, said X^a comprising boron, or a member of Group 14 of the Periodic Table of the Elements, and also comprising nitrogen, phosphorus, sulfur or oxygen;

X is a monovalent anionic ligand group having up to 60 atoms exclusive of the class of ligands that are cyclic ligand groups bound to M through delocalized π -electrons or two X groups together are a divalent anionic ligand group;

Z independently each occurrence is a neutral ligating compound having up to 20 atoms;

x is 0, 1, 2, or 3; and

z is 0 or 1.

Highly preferably T is =N(CH₃), X is halo or hydrocarbyl, x is 2, X' is dimethylsilane, z is
 5 0, and R¹⁰ each occurrence is hydrogen, a hydrocarbyl, hydrocarbyloxy, dihydrocarbylamino,
 hydrocarbyleneamino, dihydrocarbylamino- substituted hydrocarbyl group, or
 hydrocarbyleneamino- substituted hydrocarbyl group of up to 20 atoms not counting hydrogen, and
 optionally two R¹⁰ groups may be joined together.

Illustrative metal complexes of the foregoing formulas include the following compounds:

10 (t-butylamido)dimethyl-[6,7]benzo-[4,5:2',3'] (1-methylisoindol)-(3H)-indene-2-yl)silanetitanium
 (II) 1,4-diphenyl-1,3-butadiene,
 (t-butylamido)dimethyl-[6,7]benzo-[4,5:2',3'] (1-methylisoindol)-(3H)-indene-2-yl)silanetitanium
 (II) 1,3-pentadiene,
 (t-butylamido)dimethyl-[6,7]benzo-[4,5:2',3'] (1-methylisoindol)-(3H)-indene-2-yl)silanetitanium
 15 (III) 2-(N,N-dimethylamino)benzyl,
 (t-butylamido)dimethyl-[6,7]benzo-[4,5:2',3'] (1-methylisoindol)-(3H)-indene-2-yl)silanetitanium
 (IV) dichloride,
 (t-butylamido)dimethyl-[6,7]benzo-[4,5:2',3'] (1-methylisoindol)-(3H)-indene-2-yl)silanetitanium
 (IV) dimethyl,

 butadiene.
- 30 Other delocalized, π -bonded complexes, especially those containing other Group 4 metals,
 will, of course, be apparent to those skilled in the art, and are disclosed among other places in:
 WO 03/78480, WO 03/78483, WO 02/92610, WO 02/02577, US 2003/0004286 and US
 Patents 6,515,155, 6,555,634, 6,150,297, 6,034,022, 6,268,444, 6,015,868, 5,866,704, and
 5,470,993.

Additional examples of metal complexes that are usefully employed are metal complexes of polyvalent Lewis bases, such as compounds of the formulas:

- 5 wherein T^b is a bridging group, preferably containing 2 or more atoms other than hydrogen, X^b and Y^b are each independently selected from the group consisting of nitrogen, sulfur, oxygen and phosphorus; more preferably both X^b and Y^b are nitrogen,

- R^b and $\text{R}^{b'}$ independently each occurrence are hydrogen or C_{1-50} hydrocarbyl groups optionally containing one or more heteroatoms or inertly substituted derivative thereof. Non-limiting examples of suitable R^b and $\text{R}^{b'}$ groups include alkyl, alkenyl, aryl, aralkyl, (poly)alkylaryl and cycloalkyl groups, as well as nitrogen, phosphorus, oxygen and halogen substituted derivatives thereof. Specific examples of suitable R^b and $\text{R}^{b'}$ groups include methyl, ethyl, isopropyl, octyl, phenyl, 2,6-dimethylphenyl, 2,6-di(isopropyl)phenyl, 2,4,6-trimethylphenyl, pentafluorophenyl, 3,5-trifluoromethylphenyl, and benzyl;

- 15 g is 0 or 1;

M^b is a metallic element selected from Groups 3 to 15, or the Lanthanide series of the Periodic Table of the Elements. Preferably, M^b is a Group 3-13 metal, more preferably M^b is a Group 4-10 metal;

- 20 L^b is a monovalent, divalent, or trivalent anionic ligand containing from 1 to 50 atoms, not counting hydrogen. Examples of suitable L^b groups include halide; hydride; hydrocarbyl, hydrocarbyloxy; di(hydrocarbyl)amido, hydrocarbyleneamido, di(hydrocarbyl)phosphido;

hydrocarbylsulfido; hydrocarbyloxy, tri(hydrocarbylsilyl)alkyl; and carboxylates. More preferred L^b groups are C_{1-20} alkyl, C_{7-20} aralkyl, and chloride;

h is an integer from 1 to 6, preferably from 1 to 4, more preferably from 1 to 3, and j is 1 or 2, with the value $h \times j$ selected to provide charge balance;

5 Z^b is a neutral ligand group coordinated to M^b , and containing up to 50 atoms not counting hydrogen. Preferred Z^b groups include aliphatic and aromatic amines, phosphines, and ethers, alkenes, alkadienes, and inertly substituted derivatives thereof. Suitable inert substituents include halogen, alkoxy, aryloxy, alkoxycarbonyl, aryloxycarbonyl, di(hydrocarbyl)amine, tri(hydrocarbyl)silyl, and nitrile groups. Preferred Z^b groups include triphenylphosphine,
10 tetrahydrofuran, pyridine, and 1,4-diphenylbutadiene;

f is an integer from 1 to 3;

two or three of T^b , R^b and $R^{b'}$ may be joined together to form a single or multiple ring structure;

h is an integer from 1 to 6, preferably from 1 to 4, more preferably from 1 to 3;

15 ~~~~~~~~~ indicates any form of electronic interaction, especially coordinate or covalent bonds, including multiple bonds, arrows signify coordinate bonds, and dotted lines indicate optional double bonds.

In one embodiment, it is preferred that R^b have relatively low steric hindrance with respect to X^b . In this embodiment, most preferred R^b groups are straight chain alkyl groups, straight chain
20 alkenyl groups, branched chain alkyl groups wherein the closest branching point is at least 3 atoms removed from X^b , and halo, dihydrocarbylamino, alkoxy or trihydrocarbylsilyl substituted derivatives thereof. Highly preferred R^b groups in this embodiment are C_{1-8} straight chain alkyl groups.

At the same time, in this embodiment $R^{b'}$ preferably has relatively high steric hindrance
25 with respect to Y^b . Non-limiting examples of suitable $R^{b'}$ groups for this embodiment include alkyl or alkenyl groups containing one or more secondary or tertiary carbon centers, cycloalkyl, aryl, alkaryl, aliphatic or aromatic heterocyclic groups, organic or inorganic oligomeric, polymeric or cyclic groups, and halo, dihydrocarbylamino, alkoxy or trihydrocarbylsilyl substituted derivatives thereof. Preferred $R^{b'}$ groups in this embodiment contain from 3 to 40, more preferably from 3 to
30 30, and most preferably from 4 to 20 atoms not counting hydrogen and are branched or cyclic.

Examples of preferred T^b groups are structures corresponding to the following formulas:

Each R^d is C_{1-10} hydrocarbyl group, preferably methyl, ethyl, n-propyl, i-propyl, t-butyl, phenyl, 2,6-dimethylphenyl, benzyl, or tolyl. Each R^e is C_{1-10} hydrocarbyl, preferably methyl, ethyl, n-propyl, i-propyl, t-butyl, phenyl, 2,6-dimethylphenyl, benzyl, or tolyl. In addition, two or more R^d or R^e groups, or mixtures of R^d and R^e groups may together form a polyvalent derivative of a hydrocarbyl group, such as, 1,4-butylene, 1,5-pentylene, or a multicyclic, fused ring, polyvalent hydrocarbyl- or heterohydrocarbyl- group, such as naphthalene-1,8-diyl.

Preferred examples of the foregoing polyvalent Lewis base complexes include:

wherein $R^{d'}$ each occurrence is independently selected from the group consisting of hydrogen and C_{1-50} hydrocarbyl groups optionally containing one or more heteroatoms, or inertly substituted derivative thereof, or further optionally, two adjacent $R^{d'}$ groups may together form a divalent bridging group;

d' is 4;

$M^{b'}$ is a Group 4 metal, preferably titanium or hafnium, or a Group 10 metal, preferably Ni or Pd;

$L^{b'}$ is a monovalent ligand of up to 50 atoms not counting hydrogen, preferably halide or hydrocarbyl, or two $L^{b'}$ groups together are a divalent or neutral ligand group, preferably a C_{2-50} hydrocarbylene, hydrocarbadiyl or diene group.

The polyvalent Lewis base complexes additionally include Group 4 metal derivatives, especially hafnium derivatives of hydrocarbylamine substituted heteroaryl compounds corresponding to the formula:

wherein:

R^{11} is selected from alkyl, cycloalkyl, heteroalkyl, cycloheteroalkyl, aryl, and inertly substituted derivatives thereof containing from 1 to 30 atoms not counting hydrogen or a divalent derivative thereof;

T^1 is a divalent bridging group of from 1 to 41 atoms other than hydrogen, preferably 1 to 20 atoms other than hydrogen, and most preferably a mono- or di- C_{1-20} hydrocarbyl substituted methylene or silane group; and

R^{12} is a C_{5-20} heteroaryl group containing Lewis base functionality, especially a pyridin-2-yl- or substituted pyridin-2-yl group or a divalent derivative thereof;

M^1 is a Group 4 metal, preferably zirconium or hafnium;

X^1 is an anionic, neutral or dianionic ligand group;

5 x' is a number from 0 to 5 indicating the number of such X^1 groups; and

bonds, optional bonds and electron donative interactions are represented by lines, dotted lines and arrows respectively.

Preferred complexes are those wherein ligand formation results from hydrogen elimination from the amine group and optionally from the loss of one or more additional groups, especially from R^{12} . In addition, electron donation from the Lewis base functionality, preferably an electron pair, provides additional stability to the metal center. Preferred metal complexes correspond to the formula:

M^1 , X^1 , x' , R^{11} and T^1 are as previously defined,

15 R^{13} , R^{14} , R^{15} and R^{16} are hydrogen, halo, or an alkyl, cycloalkyl, heteroalkyl, heterocycloalkyl, aryl, or silyl group of up to 20 atoms not counting hydrogen, or adjacent R^{13} , R^{14} , R^{15} or R^{16} groups may be joined together thereby forming fused ring derivatives, and

bonds, optional bonds and electron pair donative interactions are represented by lines, dotted lines and arrows respectively.

20 More preferred examples of the foregoing metal complexes correspond to the formula:

M^1 , X^1 , and x' are as previously defined,

R^{13} , R^{14} , R^{15} and R^{16} are as previously defined, preferably R^{13} , R^{14} , and R^{15} are hydrogen, or C_{1-4} alkyl, and R^{16} is C_{6-20} aryl, most preferably naphthalenyl;

R^a independently each occurrence is C_{1-4} alkyl, and a is 1-5, most preferably R^a in two ortho- positions to the nitrogen is isopropyl or t-butyl;

R^{17} and R^{18} independently each occurrence are hydrogen, halogen, or a C_{1-20} alkyl or aryl group, most preferably one of R^{17} and R^{18} is hydrogen and the other is a C_{6-20} aryl group, especially
 5 2-isopropyl, phenyl or a fused polycyclic aryl group, most preferably an anthracenyl group, and
 bonds, optional bonds and electron pair donative interactions are represented by lines, dotted lines and arrows respectively.

Highly preferred metal complexes correspond to the formula:

10 wherein X^1 each occurrence is halide, N,N-dimethylamido, or C_{1-4} alkyl, and preferably each occurrence X^1 is methyl;

R^c , R^f and R^b independently each occurrence are halogen, C_{1-20} alkyl, or C_{6-20} aryl, or two adjacent R^c , R^f or R^b groups are joined together thereby forming a ring, c is an integer from 1 to 4, and f and g , independently is integers from 1-5; and

15 R^h independently each occurrence is hydrogen or C_{1-6} alkyl.

Additional examples of metal complexes are complexes of the following formulas:

wherein R^x is C_{1-4} alkyl or cycloalkyl, preferably methyl, isopropyl, t-butyl or cyclohexyl;
 and

20 X^1 each occurrence is halide, N,N-dimethylamido, or C_{1-4} alkyl, preferably methyl.

Examples of such metal complexes include:

[N-(2,6-di(1-methylethyl)phenyl)amido)(o-tolyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dimethyl;

[N-(2,6-di(1-methylethyl)phenyl)amido)(o-tolyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium di(N,N-dimethylamido);

5 [N-(2,6-di(1-methylethyl)phenyl)amido) o-tolyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dichloride;

[N-(2,6-di(1-methylethyl)phenyl)amido)(2-isopropylphenyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dimethyl;

10 [N-(2,6-di(1-methylethyl)phenyl)amido)(2-isopropylphenyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium di(N,N-dimethylamido);

[N-(2,6-di(1-methylethyl)phenyl)amido)(2-isopropylphenyl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dichloride;

[N-(2,6-di(1-methylethyl)phenyl)amido)(phenanthren-5-yl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dimethyl;

15 [N-(2,6-di(1-methylethyl)phenyl)amido)(phenanthren-5-yl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium di(N,N-dimethylamido);

[N-(2,6-di(1-methylethyl)phenyl)amido)(phenanthren-5-yl)(α -naphthalen-2-diyl(6-pyridin-2-diyl)methane)]hafnium dichloride;

20 [N-[2,6-bis(1-methylethyl)phenyl]- α -[2-(1-methylethyl)phenyl]-6-(1,2-naphthalendiyl- κ -C²)-2-pyridinemethanaminato (2-)- κ N¹, κ N²]hafnium dimethyl,

[N-[2,6-bis(1-methylethyl)phenyl]- α -[2-(1-methylethyl)phenyl]-6-(1,2-naphthalenyl- κ -C²)-2-pyridinemethanaminato (2-)- κ N¹, κ N²]hafnium di(n-butyl);

[N-[2,6-bis(1-methylethyl)phenyl]- α -[2,6-bis(1-methylethyl)phenyl]-6-(1,2-naphthalendiyl- κ -C²)-2-pyridinemethanaminato (2-)- κ N¹, κ N²]hafnium dimethyl,

25 [N-[2,6-bis(1-methylethyl)phenyl]- α -[2,6-bis(1-methylethyl)phenyl]-6-(1,2-naphthalenyl- κ -C²)-2-pyridinemethanaminato (2-)- κ N¹, κ N²]hafnium di(n-butyl)

[N-[2,6-bis(1-methylethyl)phenyl]- α -[2,6-di(1-methylethyl)phenyl]-5-(2-ethylbenzofuran-3-yl- κ -C⁴)-2-(N'-methyl)imidazol-2-yl)methanaminato (2-)- κ N¹, κ N²] hafnium dimethyl,

30 [N-[2,6-bis(1-methylethyl)phenyl]- α -[2,6-di(1-methylethyl)phenyl]-5-(2-ethylbenzofuran-3-yl- κ -C⁴)-2-(N'-methyl)imidazol-2-yl)methanaminato (2-)- κ N¹, κ N²] hafnium di(n-butyl),

[N-[2,4,6-tris(1-methylethyl)phenyl]- α -[2,6-di(1-methylethyl)phenyl]-5-(2-ethylbenzofuran-3-yl- κ -C⁴)-2-(N'-methyl)imidazol-2-yl)methanaminato (2-)- κ N¹, κ N²] hafnium di(methyl), and

[N-[2,4,6-tris(1-methylethyl)phenyl]- α -[2,6-bis(1-methylethyl)phenyl]-6-(1,2-naphthalenyl- κ -C²)-2-pyridinemethanaminato (2-)- κ N¹, κ N²]hafnium di(n-butyl).

Examples of suitable metal complexes of polyvalent Lewis bases include polyether compounds corresponding to the formula:

, where:

5 R^{20} is an aromatic or inertly substituted aromatic group containing from 5 to 20 atoms not counting hydrogen, or a polyvalent derivative thereof;

T^3 is a hydrocarbylene or silane group having from 1 to 20 atoms not counting hydrogen, or an inertly substituted derivative thereof;

M^3 is a Group 4 metal, preferably zirconium or hafnium;

10 G is an anionic, neutral or dianionic ligand group; preferably a halide, hydrocarbyl or dihydrocarbylamide group having up to 20 atoms not counting hydrogen;

g is a number from 1 to 5 indicating the number of such G groups; and

bonds and electron donative interactions are represented by lines and arrows respectively.

Preferably, such complexes correspond to the formula:

, wherein:

15 T^3 is a divalent bridging group of from 2 to 20 atoms not counting hydrogen, preferably a substituted or unsubstituted, C_{3-6} alkylene group; and

Ar^2 independently each occurrence is an arylene or an alkyl- or aryl-substituted arylene group of from 6 to 20 atoms not counting hydrogen;

M^3 is a Group 4 metal, preferably hafnium or zirconium;

20 G independently each occurrence is an anionic, neutral or dianionic ligand group;

g is a number from 1 to 5 indicating the number of such X groups; and

electron donative interactions are represented by arrows.

Examples of metal complexes of foregoing formula include the following compounds:

where M^3 is Hf or Zr;

Ar^4 is C_{6-20} aryl or inertly substituted derivatives thereof, especially 3,5-
 5 di(isopropyl)phenyl, 3,5-di(isobutyl)phenyl, dibenzo-1H-pyrrole-1-yl, or anthracen-5-yl, and

T^4 independently each occurrence comprises a C_{3-6} alkylene group, a C_{3-6} cycloalkylene
 group, or an inertly substituted derivative thereof;

R^{21} independently each occurrence is hydrogen, halo, hydrocarbyl, trihydrocarbylsilyl, or
 trihydrocarbylsilylhydrocarbyl of up to 50 atoms not counting hydrogen; and

10 G , independently each occurrence is halo or a hydrocarbyl or trihydrocarbylsilyl group of
 up to 20 atoms not counting hydrogen, or 2 G groups together are a divalent derivative of the
 foregoing hydrocarbyl or trihydrocarbylsilyl groups.

Especially preferred are compounds of the formula:

wherein Ar^4 is 3,5-di(isopropyl)phenyl, 3,5-di(isobutyl)phenyl, dibenzo-1H-pyrrole-1-yl, or anthracen-5-yl,

R^{21} is hydrogen, halo, or C_{1-4} alkyl, especially methyl

T^4 is propan-1,3-diyl or butan-1,4-diyl, and

5 G is chloro, methyl or benzyl.

A most highly preferred metal complex of the foregoing formula is:

The foregoing polyvalent Lewis base complexes are conveniently prepared by standard metallation and ligand exchange procedures involving a source of the transition metal and the neutral polyfunctional ligand source. In addition, the complexes may also be prepared by means of an amide elimination and hydrocarbylation process starting from the corresponding Group 4 metal tetraamide and a hydrocarbylating agent, such as trimethylaluminum. Other techniques may be used as well. These complexes are known from the disclosures of, among others, US patents 6,320,005, 6,103,657, WO 02/38628, WO 03/40195, and US 04/0220050.

15 Cocatalysts for Unsaturated Hard Segment Polymer Reagent Synthesis

Generally the foregoing metal complexes are rendered active for olefin polymerization by contact with an activating cocatalyst. Suitable cocatalysts include those compounds previously known in the art for use with Group 4 metal olefin polymerization complexes. Examples of suitable activating cocatalysts include neutral Lewis acids, such as C_{1-30} hydrocarbyl substituted Group 13 compounds, especially tri(hydrocarbyl)aluminum- or tri(hydrocarbyl)boron compounds and halogenated (including perhalogenated) derivatives thereof, having from 1 to 10 carbons in each hydrocarbyl or halogenated hydrocarbyl group, more especially perfluorinated tri(aryl)boron compounds, and most especially tris(pentafluorophenyl)borane; nonpolymeric, compatible, noncoordinating, ion forming compounds (including the use of such compounds under oxidizing

conditions), especially the use of ammonium-, phosphonium-, oxonium-, carbonium-, silylium- or sulfonium- salts of compatible, noncoordinating anions, or ferrocenium-, lead- or silver salts of compatible, noncoordinating anions; and combinations of the foregoing cation forming cocatalysts and techniques. The foregoing activating cocatalysts and activating techniques have been
5 previously taught with respect to different metal complexes for olefin polymerizations in the following references: EP-A-277,003, US-A-5,153,157, US-A-5,064,802, US-A-5,321,106, US-A-5,721,185, US-A-5,350,723, US-A-5,425,872, US-A-5,625,087, US-A-5,883,204, US-A-5,919,983, US-A-5,783,512, WO 99/15534, and WO99/42467.

Combinations of neutral Lewis acids, especially the combination of a trialkyl aluminum
10 compound having from 1 to 4 carbons in each alkyl group and a halogenated tri(hydrocarbyl)boron compound having from 1 to 20 carbons in each hydrocarbyl group, especially tris(pentafluorophenyl)borane, further combinations of such neutral Lewis acid mixtures with a polymeric or oligomeric alumoxane, and combinations of a single neutral Lewis acid, especially tris(pentafluorophenyl)borane with a polymeric or oligomeric alumoxane may be used as activating
15 cocatalysts. Preferred molar ratios of metal complex:tris(pentafluorophenyl)-borane:alumoxane are from 1:1:1 to 1:5:20, more preferably from 1:1:1.5 to 1:5:10.

Suitable cation forming compounds useful as cocatalysts in one embodiment of the present invention comprise a cation which is a Bronsted acid capable of donating a proton and a
compatible, noncoordinating anion, A⁻. As used herein, the term "noncoordinating" means an anion
20 or substance which either does not coordinate to the Group 4 metal containing precursor complex and the catalytic derivative derived there from, or which is only weakly coordinated to such complexes thereby remaining sufficiently labile to be displaced by a neutral Lewis base. A noncoordinating anion specifically refers to an anion which when functioning as a charge balancing anion in a cationic metal complex does not transfer an anionic substituent or fragment thereof to
25 said cation thereby forming neutral complexes. "Compatible anions" are anions which are not degraded to neutrality when the initially formed complex decomposes and are noninterfering with desired subsequent polymerization or other uses of the complex.

Preferred anions are those containing a single coordination complex comprising a charge-bearing metal or metalloid core which anion is capable of balancing the charge of the active catalyst
30 species (the metal cation) which may be formed when the two components are combined. Also, said anion should be sufficiently labile to be displaced by olefinic, diolefinic and acetylenically unsaturated compounds or other neutral Lewis bases such as ethers or nitriles. Suitable metals include, but are not limited to, aluminum, gold and platinum. Suitable metalloids include, but are not limited to, boron, phosphorus, and silicon. Compounds containing anions which comprise
35 coordination complexes containing a single metal or metalloid atom are, of course, well known and

many, particularly such compounds containing a single boron atom in the anion portion, are available commercially.

Preferably such cocatalysts may be represented by the following general formula:

5 wherein:

L^* is a neutral Lewis base;

$(L^*-H)^+$ is a conjugate Bronsted acid of L^* ;

A^{g-} is a noncoordinating, compatible anion having a charge of g^- , and

g is an integer from 1 to 3.

10 More preferably A^{g-} corresponds to the formula: $[M'Q_4]^-$;

wherein:

M' is boron or aluminum in the +3 formal oxidation state; and

15 Q independently each occurrence is selected from hydride, dialkylamido, halide, hydrocarbyl, hydrocarbyloxy, halosubstituted-hydrocarbyl, halosubstituted hydrocarbyloxy, and halo- substituted silylhydrocarbyl radicals (including perhalogenated hydrocarbyl- perhalogenated hydrocarbyloxy- and perhalogenated silylhydrocarbyl radicals), said Q having up to 20 carbons with the proviso that in not more than one occurrence is Q halide. Examples of suitable hydrocarbyloxy Q groups are disclosed in US-A-5,296,433.

20 In a more preferred embodiment, d is one, that is, the counter ion has a single negative charge and is A^- . Activating cocatalysts comprising boron which are particularly useful in addition polymerizations may be represented by the following general formula:

wherein:

L^* is as previously defined;

25 B is boron in a formal oxidation state of 3; and

Q is a hydrocarbyl-, hydrocarbyloxy-, fluorinated hydrocarbyl-, fluorinated hydrocarbyloxy-, or fluorinated silylhydrocarbyl- group of up to 20 nonhydrogen atoms, with the proviso that in not more than one occasion is Q hydrocarbyl.

30 Preferred Lewis base salts are ammonium salts, more preferably trialkylammonium salts containing one or more C_{12-40} alkyl groups. Most preferably, Q is each occurrence a fluorinated aryl group, especially, a pentafluorophenyl group.

Illustrative, but not limiting, examples of boron compounds which may be used as an activating cocatalyst in addition polymerizations are tri-substituted ammonium salts such as:

trimethylammonium tetrakis(pentafluorophenyl) borate,
 triethylammonium tetrakis(pentafluorophenyl) borate,
 tripropylammonium tetrakis(pentafluorophenyl) borate,
 tri(n-butyl)ammonium tetrakis(pentafluorophenyl) borate,
 5 tri(sec-butyl)ammonium tetrakis(pentafluorophenyl) borate,
 N,N-dimethylanilinium tetrakis(pentafluorophenyl) borate,
 N,N-dimethylanilinium n-butyltris(pentafluorophenyl) borate,
 N,N-dimethylanilinium benzyltris(pentafluorophenyl) borate,
 N,N-dimethylanilinium tetrakis(4-(t-butyl dimethylsilyl)-2, 3, 5, 6-tetrafluorophenyl) borate,
 10 N,N-dimethylanilinium tetrakis(4-(triisopropylsilyl)-2, 3, 5, 6-tetrafluorophenyl) borate,
 N,N-dimethylanilinium pentafluorophenoxytris(pentafluorophenyl) borate,
 N,N-diethylanilinium tetrakis(pentafluorophenyl) borate,
 N,N-dimethyl-2,4,6-trimethylanilinium tetrakis(pentafluorophenyl) borate,
 dimethyloctadecylammonium tetrakis(pentafluorophenyl) borate,
 15 methyldioctadecylammonium tetrakis(pentafluorophenyl) borate,
 dialkyl ammonium salts such as:

di-(i-propyl)ammonium tetrakis(pentafluorophenyl) borate,
 methyloctadecylammonium tetrakis(pentafluorophenyl) borate,
 methyloctadecylammonium tetrakis(pentafluorophenyl) borate, and
 20 dioctadecylammonium tetrakis(pentafluorophenyl) borate;
 tri-substituted phosphonium salts such as:

triphenylphosphonium tetrakis(pentafluorophenyl) borate,
 methyldioctadecylphosphonium tetrakis(pentafluorophenyl) borate, and
 tri(2,6-dimethylphenyl)phosphonium tetrakis(pentafluorophenyl) borate;

25 di-substituted oxonium salts such as:

diphenyloxonium tetrakis(pentafluorophenyl) borate,
 di(o-tolyl)oxonium tetrakis(pentafluorophenyl) borate, and
 di(octadecyl)oxonium tetrakis(pentafluorophenyl) borate;

di-substituted sulfonium salts such as:

30 di(o-tolyl)sulfonium tetrakis(pentafluorophenyl) borate, and
 methylcotadecylsulfonium tetrakis(pentafluorophenyl) borate.

Preferred (L*-H)⁺ cations are methyldioctadecylammonium cations,
 dimethyloctadecylammonium cations, and ammonium cations derived from mixtures of trialkyl
 amines containing one or 2 C₁₄₋₁₈ alkyl groups. A particularly preferred example of the latter

compound is based on a commercially available long chain amine and is referred to as: bis-(hydrogenated tallowalkyl)methylammonium tetrakis(pentafluorophenyl)borate.

Another suitable ion forming, activating cocatalyst comprises a salt of a cationic oxidizing agent and a noncoordinating, compatible anion represented by the formula:

wherein:

Ox^{h+} is a cationic oxidizing agent having a charge of $h+$;

h is an integer from 1 to 3; and

A^{g-} and g are as previously defined.

Examples of cationic oxidizing agents include: ferrocenium, hydrocarbyl-substituted ferrocenium, Ag^+ or Pb^{+2} . Preferred embodiments of A^{g-} are those anions previously defined with respect to the Bronsted acid containing activating cocatalysts, especially tetrakis(pentafluorophenyl)borate.

Another suitable ion forming, activating cocatalyst comprises a compound which is a salt of a carbenium ion and a noncoordinating, compatible anion represented by the formula:

wherein:

$[C]^+$ is a C_{1-20} carbenium ion; and

A^- is a noncoordinating, compatible anion having a charge of -1. A preferred carbenium ion is the trityl cation, that is triphenylmethylum.

A further suitable ion forming, activating cocatalyst comprises a compound which is a salt of a silylium ion and a noncoordinating, compatible anion represented by the formula:

wherein:

Q^I is C_{1-10} hydrocarbyl, and A^- is as previously defined.

Preferred silylium salt activating cocatalysts are trimethylsilylium tetrakis(pentafluorophenyl)borate, triethylsilylium tetrakis(pentafluorophenyl)borate and ether substituted adducts thereof. Silylium salts have been previously generically disclosed in J. Chem Soc. Chem. Comm., 1993, 383-384, as well as Lambert, J. B., et al., Organometallics, 1994, 13, 2430-2443. The use of the above silylium salts as activating cocatalysts for addition polymerization catalysts is disclosed in US-A-5,625,087.

Certain complexes of alcohols, mercaptans, silanols, and oximes with tris(pentafluorophenyl)borane are also effective catalyst activators. Such cocatalysts are disclosed in US-A-5,296,433.

A class of cocatalysts comprising non-coordinating anions generically referred to as expanded anions, further disclosed in US Patent 6,395,671, may be suitably employed for olefin polymerizations. Generally, these cocatalysts (illustrated by those having imidazolid, substituted imidazolid, imidazolinide, substituted imidazolinide, benzimidazolid, or substituted benzimidazolid anions) may be depicted as follows:

wherein:

A^{*+} is a cation, especially a proton containing cation, and preferably is a trihydrocarbyl ammonium cation containing one or two C_{10-40} alkyl groups, especially a methyldi (C_{14-20} alkyl) ammonium cation,

Q^3 , independently each occurrence, is hydrogen or a halo, hydrocarbyl, halocarbyl, halohydrocarbyl, silylhydrocarbyl, or silyl, (including mono-, di- and tri(hydrocarbyl)silyl) group of up to 30 atoms not counting hydrogen, preferably C_{1-20} alkyl, and

Q^2 is tris(pentafluorophenyl)borane or tris(pentafluorophenyl)alumane).

Examples of these catalyst activators include trihydrocarbylammonium- salts, especially, methyldi(C_{14-20} alkyl) ammonium- salts of:

bis(tris(pentafluorophenyl)borane)imidazolid,
 bis(tris(pentafluorophenyl)borane)-2-undecylimidazolid,
 bis(tris(pentafluorophenyl)borane)-2-heptadecylimidazolid,
 bis(tris(pentafluorophenyl)borane)-4,5-bis(undecyl)imidazolid,
 bis(tris(pentafluorophenyl)borane)-4,5-bis(heptadecyl)imidazolid,
 bis(tris(pentafluorophenyl)borane)imidazolinide,
 bis(tris(pentafluorophenyl)borane)-2-undecylimidazolinide,
 bis(tris(pentafluorophenyl)borane)-2-heptadecylimidazolinide,
 bis(tris(pentafluorophenyl)borane)-4,5-bis(undecyl)imidazolinide,
 bis(tris(pentafluorophenyl)borane)-4,5-bis(heptadecyl)imidazolinide,
 bis(tris(pentafluorophenyl)borane)-5,6-dimethylbenzimidazolid,
 bis(tris(pentafluorophenyl)borane)-5,6-bis(undecyl)benzimidazolid,
 bis(tris(pentafluorophenyl)alumane)imidazolid,
 bis(tris(pentafluorophenyl)alumane)-2-undecylimidazolid,

bis(tris(pentafluorophenyl)alumane)-2-heptadecylimidazolide,
bis(tris(pentafluorophenyl)alumane)-4,5-bis(undecyl)imidazolide,
bis(tris(pentafluorophenyl)alumane)-4,5-bis(heptadecyl)imidazolide,
bis(tris(pentafluorophenyl)alumane)imidazolinide,
5 bis(tris(pentafluorophenyl)alumane)-2-undecylimidazolinide,
bis(tris(pentafluorophenyl)alumane)-2-heptadecylimidazolinide,
bis(tris(pentafluorophenyl)alumane)-4,5-bis(undecyl)imidazolinide,
bis(tris(pentafluorophenyl)alumane)-4,5-bis(heptadecyl)imidazolinide,
bis(tris(pentafluorophenyl)alumane)-5,6-dimethylbenzimidazolide, and
10 bis(tris(pentafluorophenyl)alumane)-5,6-bis(undecyl)benzimidazolide.

Other activators include those described in PCT publication WO 98/07515 such as tris (2, 2', 2''-nonafluorobiphenyl)fluoroaluminate. Combinations of activators are also suitable, for example, alumoxanes and ionizing activators in combinations, see for example, EP-A-0 573120, PCT publications WO 94/07928 and WO 95/14044 and US Patents 5,153,157 and 5,453,410. WO
15 98/09996 describes activating catalyst compounds with perchlorates, periodates and iodates, including their hydrates. WO 99/18135 describes the use of organoboroaluminum activators. WO 03/10171 discloses catalyst activators that are adducts of Bronsted acids with Lewis acids. Other activators or methods for activating a catalyst compound are described in for example, US Patents 5,849,852, 5,859, 653, 5,869,723, EP-A-615981, and PCT publication WO 98/32775.

20 As previously mentioned, suitable activating cocatalysts include polymeric or oligomeric alumoxanes, especially methylalumoxane (MAO), triisobutyl aluminum modified methylalumoxane (MMAO), or isobutylalumoxane; Lewis acid modified alumoxanes, especially perhalogenated tri(hydrocarbyl)aluminum- or perhalogenated tri(hydrocarbyl)boron modified alumoxanes, having from 1 to 10 carbons in each hydrocarbyl or halogenated hydrocarbyl group, and most especially
25 tris(pentafluorophenyl)borane modified alumoxanes. Such cocatalysts are previously disclosed in USP's 6,214,760, 6,160,146, 6,140,521, and 6,696,379.

The molar ratio of catalyst/cocatalyst employed preferably ranges from 1:10,000 to 100:1, more preferably from 1:5000 to 10:1, most preferably from 1:1000 to 1:1. Alumoxane, when used by itself as an activating cocatalyst, may be employed in lower quantity (<100:1) than the
30 predominant catalyst literature, which is generally at least 100 times the quantity of metal complex on a molar basis, and more often around 1000 times this quantity. Tris(pentafluorophenyl)borane, where used as an activating cocatalyst is employed in a molar ratio to the metal complex of from 0.5:1 to 10:1, more preferably from 1:1 to 6:1 most preferably from 1:1 to 5:1. The remaining activating cocatalysts are generally employed in approximately equimolar quantity with the metal
35 complex.

DIENE ELASTOMER PREPARATION

The foregoing addition polymerization conditions may be employed for preparation of suitable diene based elastomers used in the present cross-metathesis, especially where reduced levels of unsaturation and/or low levels of vinyl (pendant) unsaturation due to 1,2-addition in the resulting elastomers are desired. For such polymers, copolymerization of the diene with ethylene or similar olefin under coordination polymerization conditions is preferred. In addition, anionic polymerization conditions are acceptable for use, especially where no copolymerizable olefin comonomer is employed. For polymerization of polar group containing diene monomers and for conjugated diene homopolymerizations, free radical polymerization conditions may also be used.

The level of unsaturation in the diene polymer (and thus the length of polymer segment produced in the metathesis product) may be controlled by hydrogenation or other suitable technique well known to the skilled artisan. Alternatively, an olefin, such as ethylene, or a cyclic olefin such as cyclooctene may be employed during the metathesis to decrease or increase the molecular weight of the metathesis products.

METATHESIS CONDITIONS

Once prepared, the unsaturated polymers are contacted with the metathesis catalyst under conditions to cause olefin cleavage and rearrangement of the cleavage products. The various catalyst compositions that have been found to be effective in promoting olefin metathesis reactions or ring-opening polymerizations of unsaturated alicyclic monomers are also effective catalyst compositions for promoting the processes of the present invention. These catalyst compositions may be either heterogeneous or homogeneous with the former having the advantage of being more readily removable from the reaction products while the latter are generally more efficient from the standpoint of catalytic activity.

Examples of suitable catalyst compositions include organic or inorganic derivatives of transition metals selected from Groups 5-10, preferably molybdenum, tantalum, tungsten, ruthenium, or rhenium, either in the form of solids, dispersions, suspensions, solutions, or neat. In the solid form, the catalyst or the individual components thereof may be supported on the surface of an inert carrier or support, such as a high surface area metal oxide, metalloid oxide, metal carbide, metal boride, metal nitride, zeolite or clay. Preferred compounds include ruthenium, molybdenum or tungsten compounds or complexes, especially halides, oxyhalides, tetraorganoammonium tungstates, tetraorganoammonium molybdenates, Lewis base derivatives thereof, and mixtures of the foregoing.

Examples of suitable homogeneous catalyst compositions employed in the practice of this invention include those previously disclosed in USP 4,010,224, especially compositions comprising: (A) at least one organometallic compound wherein the metal is selected from Groups 1,

2, 12 or 13 of the Periodic Table of Elements, (B) at least one metal derivative wherein the metal is selected from the group consisting of metals of Groups 5, 6, or 7, especially molybdenum or tungsten and, optionally, (C) at least one chelating- or Lewis base- material. Examples of the latter compounds include ethers, carboxylic acid esters, ketones, aldehydes, carbonates, nitriles, alcohols, thiols, water, and mixtures thereof.

Representative examples of organometallic compounds from which component (A) may be selected include lithium, sodium, potassium, rubidium, cesium, beryllium, magnesium, calcium, strontium, barium, zinc, cadmium, aluminum, gallium, indium, and thallium compounds, with lithium, sodium, magnesium, aluminum, zinc and cadmium compounds being preferred and with aluminum compounds being most preferred.

Representative examples of organometallic compounds useful as catalyst component (A) are organoaluminum compounds having at least one aluminum-to-carbon bond. Representative of such compounds are tri(C₁₋₁₀)hydrocarbylaluminum compounds such as trimethylaluminum, triethylaluminum, tri-n-propylaluminum, tri-n-butylaluminum, triisopropylaluminum, triisobutylaluminum, trihexylaluminum, trioctylaluminum, tritolylaluminum, tribenzylaluminum, and triphenylaluminum; organoaluminum halides such as diethylaluminum chloride, di-n-propylaluminum chloride, diisobutylaluminum chloride, diethylaluminum bromide, diethylaluminum iodide and diethylaluminum fluoride, ethylaluminum dichloride, ethylaluminum sesquichloride, ethylaluminum dibromide, propylaluminum dichloride, isobutylaluminum dichloride, ethylaluminum diiodide, phenylaluminum dibromide, tolylaluminum dibromide, benzylaluminum dibromide, phenylaluminum diiodide, tolylaluminum diiodide, benzylaluminum diiodide, diphenylaluminum chloride, ditolylaluminum chloride, and dibenzylaluminum bromide; organoaluminum hydride compounds such as diphenylaluminum hydride and phenylaluminum dihydride; and mixtures of the foregoing.

Additional suitable organometallic compounds are alkali metal compounds such as ethyllithium, n-butyllithium, t-butyllithium, amylsodium, butylpotassium, phenylpotassium, phenylsodium, phenyllithium, lithium-aluminum tetrabutyl, lithium-aluminum tetraethyl, lithium-aluminum triethyl chloride, and sodium aluminum tetraethyl; alkaline earth metal compounds such as diphenylmagnesium, diethylmagnesium, ethylmagnesium chloride, phenylmagnesium chloride, butylmagnesium bromide, butyl calcium chloride, and diethylbarium; Group 12 organometal compounds such as diethylzinc, diphenylzinc, ethylzinc chloride, diethylcadmium, and dibutylcadmium; phenylmagnesium bromide, butylmagnesium chloride, butylmagnesium bromide, and ethylmagnesium chloride; and mixtures of the foregoing compounds. Preferred compounds for use as component (A) are trialkylaluminums, dialkylaluminum halides, alkylaluminum dihalides and aluminumsesquihalides, containing up to 4 carbons in each alkyl group.

Suitable derivatives of molybdenum and tungsten useful as component (B) of the metathesis catalyst include the corresponding halides-, acetylacetonates-, sulphates-, phosphates-, nitrates-, and alcoholates. Examples include: chlorides, bromides, iodides and fluorides, such as molybdenum pentachloride, tungsten hexachloride, molybdenum pentabromide, tungsten hexabromide,
5 molybdenum pentaiodide, molybdenum pentafluoride, molybdenum hexafluoride and tungsten hexafluoride. Other examples include molybdenum phosphate, tungsten phosphate, molybdenum nitrate, tungsten nitrate, molybdenum acetylacetonate, tungsten acetylacetonate, molybdenum sulphate, and tungsten sulphate. Mixtures of these compounds may also be employed. The tungsten- and molybdenum halides, representative of which are tungsten hexachloride and
10 molybdenum pentachloride, are especially preferred.

Suitable compounds for use as component (C) of the catalyst composition are compounds of the general formula R-Y-H wherein Y is selected from the group of oxygen and sulfur and wherein R is hydrogen, or a hydrocarbyl or substituted hydrocarbyl group having up to 20 carbons total, and wherein the substituent(s) on the hydrocarbyl group are selected from the group
15 consisting of hydroxy, thio, hydrocarbyloxy, hydrocarbylthio, oxy- and sulfo-. Examples include water, hydrogen sulfide, alkanols, aromatic alcohols, mercaptans, hydrocarbylperoxides, polyalcohols, polymercaptans, hydroxy mercaptans, alkanolethers, alkanolthioethers, mercaptoethers and mercaptothioethers. Representative examples of the materials for use as component (C) include alcohols such as methanol, ethanol, isopropanol, tertiarybutyl alcohol, amyl
20 alcohol, benzyl alcohol, allyl alcohol, 1,1-dimethyl benzyl alcohol, phenol, tertiarybutyl catechol, cresol, alpha and beta naphthyl alcohol; mercaptans such as methyl-, ethyl-, propyl-, isopropyl-, butyl-, amyl- or allylmercaptan, thiophenol, 4-methylthiophenol, or 4-mercaptophenol; hydroperoxides, such as, cumyl hydroperoxide, tertiarybutyl hydroperoxide; hydrodisulfides such as cumyl hydrodisulfide, and s-butyl hydrodisulfide; polyalcohols, such as ethylene glycol, glycerol,
25 polyethyleneglycol, catechol, resorcinol, hydroquinone, pyrogallol; polymercaptans, such as 1,3-propane dithiol, 1,4-dithiobenzene; and hydroxymercaptans, such as, 1-hydroxy-2-thioethane or 1-hydroxy-4-thiobenzene.

The quantity of component (C) employed in the foregoing catalyst composition is adjusted to control the activity of the catalyst composition. Generally, the catalyst composition exhibits
30 higher activity when the quantity of component (C) employed is relatively small, including none.

Generally the quantities of the respective catalyst components are adjusted to be within a molar ratio of (B)/(C) ranging from 0.3/1 to 20/1 and the molar ratio of (A)/(B) is within the range of 0.5/1 to 15/1. More preferred ratios of (B)/(C) are from 0.5/1 to 5/1 and (A)/(B) from 0.5/1 to 8/1. Still more preferred ratios of (B)/(C) are 1/1 to 2/1 and (A)/(B) are 0.75/1 to 5/1.

The foregoing catalyst compositions may be prepared by mixing the components by known techniques, either prior to combination with the olefin containing polymer or "in situ". By the "preformed" method the catalyst components are mixed together prior to exposure of any of the catalyst components to the olefin containing polymer to be used in the process of this invention. In the "in situ" method the catalyst components are added separately to the reaction mixture containing the unsaturated polymer to be subjected to metathesis. The catalyst components may be mixed either as pure compounds or as suspensions or solutions in liquids which do not adversely affect the catalyst activity of the olefin metathesis reaction. Representative of such liquids are saturated hydrocarbons such as hexane, pentane, benzene, toluene or mixtures thereof.

The order of addition of the three catalyst components to each other may be varied. All of the following practices may suitably be employed:

1. simultaneous addition of components (A), (B) and (C);
2. sequential addition of components (A), (B) and (C) in any order;
3. contacting of any two components, optionally with recovery or purification of the reaction product, followed by addition of the binary product to the remaining component; or
4. contacting of mixtures of any two components with subsequent contact of the resulting binary mixtures or reaction products, whether purified or unpurified.

In one preferred embodiment, the catalyst composition comprises at least one organoaluminum halide and at least one tungsten derivative. Preferred organoaluminum halides are dialkylaluminum chloride, di-n-propylaluminum chloride, diisobutylaluminum chloride, diethylaluminum bromide, diethylaluminum iodide, diethylaluminum fluoride, ethylaluminum sesquichloride, ethylaluminum sesquibromide, ethylaluminum dichloride, ethylaluminum dibromide, propylaluminum dichloride, isobutylaluminum dichloride, ethylaluminum diiodide, phenylaluminum dibromide, tolylaluminum dibromide, benzylaluminum dibromide, phenylaluminum diiodide, tolylaluminum diiodide, benzylaluminum diiodide, diphenylaluminum chloride, ditolylaluminum chloride, dibenzylaluminum bromide, and mixtures of the foregoing.

Preferred tungsten derivatives include halides-, sulfates-, phosphates-, nitrates- and carboxylates- of tungsten in the +4 or +6 oxidation state, preferably tungsten hexachloride, tungsten hexabromide, tungsten hexaiodide, tungsten hexafluoride, tungsten diphosphate, tungsten hexantrate, tungsten triacetylacetonate, tungsten oxychloride, and tungsten trisulphate. A most preferred tungsten derivative is tungsten hexachloride.

The molar relationship between the two catalyst components in this embodiment are generally from 0.5/1 to 15/1, more preferably from 0.7/1 to 8/1, and a still more preferably from 0.8/1 to 5/1. The catalyst components may be reacted together as pure compounds or in solutions or

suspensions in inert, aliphatic or aromatic liquids. Representative of such liquids are pentane, hexane, benzene, and toluene.

A third catalyst composition that is effective in promoting the present metathesis process comprises an aluminum trihalide and an organic or inorganic derivative of a Group 5, 6 or 7 compound, preferably a tungsten compound, especially those wherein the tungsten is in an oxidation state from 4 to 6. The preferred aluminum trihalides are aluminum trichloride or aluminum tribromide. Preferred tungsten compounds are tetra-, penta- and hexa- chlorides, bromides, and iodides, tungsten hexafluoride and the tungsten oxychlorides. Optionally an organometallic compound may be present in the catalyst composition as an aid in the suppression of gel formation and in order to increase polymerization rates at lower catalyst levels. Examples of suitable optional organometallic compounds include alkyl-, aryl-, and alkaryl derivatives of lithium, sodium, magnesium, calcium, strontium and barium; alkylhalide-, arylhalide-, and alkarylhalide derivatives of magnesium, calcium, strontium or barium and alkyl-, aryl- or alkaryl- derivatives of Group 12 metals such as dialkyl- and diarylzinc, said alkyl, aryl or alkaryl group having up to 10 carbons.

Other classes of catalysts which are effective in promoting the polymerizations of this invention are those disclosed in USP 4,994,535, and generally include an organometal derivative of a Group 13-14 metal, especially organo- or organohalo- derivatives of aluminum or tin, preferably tetraalkyl tin, trialkyl aluminum and dialkylaluminum halides, containing up to 10 carbons in each alkyl group; at least one derivative of a Group 5, 6, or 7 metal, especially molybdenum or tungsten; and optionally, a chelating agent, such as a Lewis base.

Additional suitable metathesis catalysts for use in the present invention are ruthenium or osmium complexes such as those disclosed in USP's 6,838,489, 6,818,586, 6,806,325, 6,624,265, 6,313,332, 5,977,393, 5,917,071, 5,710,298, 5,750,815, 5,728,917, 5,312,940, and 5,342,909. Examples of the foregoing metathesis catalysts include ruthenium and osmium carbene complexes possessing metal centers that are formally in the +2 oxidation state, have an electron count of 16, and are penta-coordinated. These complexes are of the general formula:

wherein:

30

M^{A} is ruthenium or osmium;

X^{A} and X^{B} are the same or different anionic ligands, preferably chloride;

L^{A} is a neutral electron donor ligand;

L^B is a neutral electron donor ligand or a nitrogen containing heterocyclic carbene; and

R^A and R^B are independently each occurrence hydrogen, or an alkyl, alkenyl, alkynyl, aryl, carboxylate, alkoxy, alkenyloxy, alkynyloxy, aryloxy, alkoxycarbonyl, alkylthio, alkylsulfonyl, alkylsulfinyl, or silyl group of up to 20 atoms not counting hydrogen, an alkyl, alkoxy, aryl, aralkyl, haloalkyl, haloalkoxy, haloaryl or haloalkaryl substituted derivative thereof; or a functionalized derivative of any of the foregoing wherein the functional group is hydroxyl, thiol, alcohol, sulfonic acid, phosphine, thioether, ketone, aldehyde, ester, ether, amine, imine, amide, imide, imido, nitro, carboxylic acid, disulfide, carbonate, isocyanate, carbodiimide, carboalkoxy, carbamate, acetal, ketal, boronate, cyano, cyanohydrin, hydrazine, oxime, hydrazide, enamine, sulfone, sulfide, sulfenyl, or halogen.

In a preferred embodiment, the metal complexes are ruthenium derivatives wherein L^B is a tertiary phosphine, especially triphenylphosphine, and L^A is either a tertiary phosphine or a nitrogen containing heterocyclic ligand, especially an imidazolidinyl- or triazolyl- ligand of the formula:

wherein Ar independently each occurrence is an aryl group, especially phenyl or 2,4,6-trimethylphenyl, and R^C independently each occurrence is hydrogen or an anionic ligand group or multiple R^C groups collectively may form one or more rings that are fused to the imidazolidine ring.

The inclusion of an imidazolidinyl or triazolyl ligand to the previously described ruthenium or osmium catalysts improves the properties of the complexes in olefin metathesis processes. In particular, the catalysts maintain the general functional group tolerance towards olefins of ruthenium-phosphine complexes while possessing enhanced metathesis activity comparable to tungsten- and molybdenum- salt ternary compositions. Such catalysts (referred to as Grubbs II catalysts) are particularly desired for metathesis of polar group containing polymers.

The operating conditions which are employed in the processes of this invention may vary. The reactions can be conveniently carried out in a liquid form, including in a melt, or even in the solid phase, such as the previously disclosed surface depolymerizing system. Thus, when a polymeric material is employed in any particular reaction, it is possible to carry out the reaction in solution, in a melt or as a "swollen" solid, employing solvent to enter the polymer matrix and/or partially dissolve the polymer or the depolymerized reaction products from the metathesis. Solvents which can be used when solution conditions are employed include any inert liquid that dissolves or swells the polymers employed. Convenient solvents are aliphatic, aromatic or cycloaliphatic

hydrocarbons which do not themselves inhibit or interfere with the metathesis reaction, such as pentane, hexane, benzene, toluene, and cyclohexane. When one or more of the olefin reactants is a liquid, the reaction can be conducted in bulk, that is, in the absence of a separately added solvent.

A small quantity of ethylene may be included in the reaction mixture, as is known in the art, for purposes of reducing the molecular weight of one or more of the ethylenically unsaturated monomers prior to metathesis. Generally, the quantity of ethylene employed is from 0.5 to 10 moles, preferably from 0.5 to 2 moles, per mole of metathesis catalyst.

The amount of metathesis catalyst employed in the reactions of this invention may be varied over wide concentrations and has not been found to be critical. The optimum amount of catalyst composition employed depends upon a number of factors such as temperature, purity of reactants, and the desired reaction time. The catalyst is desirably employed in an amount (based on weight of transition metal component) from 0.01 to 1 percent based on weight of unsaturated polymer.

Metathesis process conditions may vary widely over any operable conditions suitable for preparing the polymer compositions of this invention. Any temperature below the decomposition temperatures of the reactant polymers, product polymer(s), and metathesis catalyst, and preferably below the normal boiling point of any solvent or diluent, if used, is generally suitable. When the metathesis is conducted in a neat polymer melt, the process temperature may broadly range from about 100°C up to about 350°C, depending upon the decomposition temperatures as noted hereinbefore. Generally, a temperature of about 20°C to 50°C above the polymer melt or glass transition temperature is preferred. When the metathesis is conducted with the reactant polymers dissolved in a liquid diluent or solvent, the temperature may typically range from about 25°C up to about 150°C. Preferred temperatures for use with the preferred Grubbs catalysts range from about 35°C up to about 100°C, more preferably, up to about 85°C. Typically, a process pressure of about 1 atmosphere is suitable, but higher and lower pressures may be employed if desired. Metathesis processes reach an equilibrium, thus conversion of the reactant polymers is typically incomplete. Samples may be taken from the reaction mixture and analyzed via CRYSTAF or ATREF, for example, to determine when the equilibrium conversion is reached. The metathesis reaction can be stopped at any time prior to reaching equilibrium conversion to obtain different distributions of product polymers.

Once the metathesis has proceeded to the extent desired, the catalyst may be inactivated, and if desired, the resulting polymer may be hydrogenated to remove residual unsaturation. Suitable methods of inactivating the metathesis catalyst include reaction with water; an alcohol; a carboxylic acid, or a metal salt or ester derivative thereof; or carbon monoxide. The resulting catalyst residue may be removed from the polymer by filtration, solvent extraction, or other suitable technique, or may be left in the polymer. Suitable hydrogenation catalysts include those previously

known in the art, especially noble metal catalysts such as platinum or palladium containing compounds or complexes.

EXAMPLES

It is understood that the present invention is operable in the absence of any component which has not been specifically disclosed and may be combined with any other suitable reaction or process in a multistep system design. The following examples are provided in order to further illustrate the invention and are not to be construed as limiting. Unless stated to the contrary, all parts and percentages are expressed on a weight basis.

In the examples hereinafter, the term "Grubbs II catalyst" refers to a metathesis catalyst consisting of benzylidene[1,3-bis(2,4,6-trimethylphenyl)-2-imidazolidinylidene]dichloro (tricyclohexylphosphine)ruthenium.

All metathesis reactions are conducted under an inert atmosphere of nitrogen gas.

Unsaturated Reagent Polymers

In the following preparations, the unsaturation level of the reagent polymer is calculated from ^1H NMR spectral data.

Polybutadiene (PBD) (2 percent 1,2-vinyl, 98 percent cis 1,4-polymerization, approximate Mw = 250,000 g/mol, available from Scientific Polymer Products). Ethylenic carbon content = 42 percent.

Hydrogenated Polybutadiene (HPBD) PBD is partially hydrogenated substantially according to the procedure described in *J. Polym. Sci. Polym. Chem.*, 1992, 30, 397-408. Accordingly, a 2 percent solution is prepared by dissolving PBD in o-xylene and heating to 95 °C followed by the addition of p-toluenesulfonyl hydrazide (TSH) and tri(n-propyl)amine TPA (1.1 moles per mole unsaturation for both TSH and TPA). After refluxing for 4 hours, the solution is cooled to room temperature and precipitated by addition to methanol. The dried filtered solid is re-precipitated by dissolving in warm toluene and adding to methanol. Hydrogenation level is 90 percent as determined by ^1H NMR spectrographic analysis. Unsaturation level is 5.5 mole percent. Tm = 109 °C.

Hydrogenated nitrile/butadiene rubber (HNBR) A partially hydrogenated acrylonitrile/butadiene random copolymer (hydrogenation of ethylenic unsaturation approximately 90 percent), having acrylonitrile content of 33 percent and a Mooney-Viscosity UML (1+4)@100 °C of 61 (THERBAN™ 3467, available from Lanxess, Inc). Tg = -25 °C. Unsaturation level is 0.81 mole percent.

Ethylene/ 1-octene/ Butadiene Copolymer Copolymerizations of mixtures of ethylene and 1-octene with butadiene are conducted in a computer controlled 2 L Parr batch reactor, which is heated by an electrical heating mantle and cooled by an internal serpentine cooling coil with chilled

water. The bottom of the reactor is fitted with a stainless steel ball valve which empties the reactor contents into a stainless steel vessel containing a toluene solution of a standard stabilizer and antioxidant. The polymer mixture is purged with nitrogen for 20 minutes after discharge into the collection vessel.

5 All chemicals and catalysts are manipulated in a nitrogen-filled drybox. The 1-octene, butadiene and mixed hexanes solvent (Isopar TM E, available from ExxonMobil Chemicals, Inc.) are purified by passage through alumina (8 x 14 A2 alumina, available from UOP Corporation) then a catalyst (Q5 TM reactant, available from Engelhard Corporation). Ethylene is passed through a first column containing alumina (A204 TM available from LaRouch, Inc.) followed by 0.4 nm molecular
10 sieves and then through a second column containing Q5 TM reactant. The nitrogen used for all transfers is passed through a single column containing A204 alumina, 0.4 nm molecular sieves and Q5 TM reactant.

The reactor is charged from a shot tank containing a pre-weighed quantity of mixed alkanes (700 g) and 1-octene (20 g). The shot tank is filled to the desired level by use of a laboratory scale
15 upon which the tank is mounted. Butadiene is loaded using a computer operated controller (Emerson Micro Motion TM controller). After solvent, butadiene and 1-octene addition, the reactor is heated to the polymerization temperature and ethylene is added to achieve the desired pressure of 3.4 MPa.

The catalyst ((t-butylamido)dimethyl(1H-cyclopenta[7]-phenanthrene-2-yl)silane
20 titanium(IV) dimethyl, prepared according to US-A-6,150,297), triethyl aluminum scavenger and activator (methyldi(octadecyl)ammonium tetrakis(pentafluorophenyl)borate) are combined in the stated order in toluene under nitrogen atmosphere. This mixture is drawn into a syringe and pressure transferred into the catalyst shot tank, followed by three 5 mL rinses of toluene. After
charging the catalyst solution to the reactor, ethylene is supplied on demand at 3.4 MPa until the
25 reaction is terminated.

Polymerizations are conducted for 10 minutes and then the reactor contents are discharged to the collection vessel. After purging with nitrogen, the polymer solution is poured into a tray and placed in a lab hood overnight to evaporate solvent. The trays are then transferred to a vacuum oven and heated at 145 °C under reduced pressure to remove any remaining solvent. A total
30 polymer yield of 42 g is obtained after evaporation of the volatile components. GPC analysis reveals Mw = 200,000 and Mn = 90,000 Daltons. NMR analysis reveals that 95 percent of the double bonds are in the backbone of the polymer chain with 5 percent side-chain vinyl content and a 1-octene content of 8.5 mole percent.

A poly(ethylene-co-butadiene) is so prepared having 2.1 mole percent unsaturation and a
35 melting transition of 126°C.

A poly(ethylene-co-butadiene-co-octene) is so prepared having 0.38 mole percent unsaturation and a glass transition of -38°C.

Polycyclo-octene (PCO) Cyclo-octene (10 ml of a 1 M toluene solution) is contacted with 0.1 mole percent benzylidene-bis(tricyclohexylphosphine)dichlororuthenium and the resulting mixture is heated at 55 °C for 2 hours followed by addition of butyl vinyl ether (10 mmol). The solution is cooled and precipitated by addition to methanol. The weight average molecular weight of the resulting polymeric product is 289,000 g/mol as determined by GPC (PS standard). Ethylene carbon content is 21.8 weight percent.

Bisphenol-A Polycarbonate, Modified with Fumaryl Chloride Bisphenol-A polycarbonate modified with fumaryl chloride, such that a monomer/terminator ratio of 16/1, is prepared according to the following procedure.

A. Preparation of Solutions: Aqueous Alkaline Bisphenol-A Solution: Bisphenol-A (BisA) (6.5g, 27mmole) is weighed into a 100 ml glass bottle. The bottle is flushed with nitrogen. Then, 50ml of 1.5 mole/l sodium hydroxide solution (75 mmole NaOH) are added. The bottle is flushed with nitrogen again. The bisphenol is dissolved under slight agitation by means of a magnetic stirrer.

Triethyl Amine (Coupling Catalyst Solution): Triethylamine (2.0 g) is weighed into a 250 ml glass bottle. Dichloromethane (150 ml) is added and the resulting mixture is shaken to form a homogenous solution. The bottle is connected to a Schott automatic dispenser from which a burette is filled with the solution.

Terminator Solution: para-Tertiary butylphenol (PTBP) (0.281g; 1.87mmole) is weighed into a 100 ml glass bottle. Dichloromethane (50 ml) is added. After the terminator is dissolved by slightly shaking, the bottle is connected to a Schott automatic dispenser from which a burette is filled with the solution.

Triphosgene Solution: Bis(trichloromethyl)carbonate (triphosgene; 4.5g) is weighed into a 250 ml glass bottle, filled up with 45 ml dichloromethane, and completely dissolved by slightly shaking the bottle. The glass bottle with the triphosgene solution is connected to a Schott automatic dispenser from which a burette is filled with the solution.

B. Synthesis: A jacketed reactor is temperature controlled by a water bath at the desired temperature of 35°C. The reactor is flushed with nitrogen. The bisphenol-A solution is filled into the reactor. The agitator is started and kept at 300 rpm. The cooling water of the condenser is turned on. Dichloromethane (20 ml) is added. The pH is adjusted at 13 (+/- 0.1) by addition of 32 wt percent aqueous HCl. The triphosgene solution (27 ml) is added within 2 minutes. The resulting mixture is reacted for 30 minutes. The pH is adjusted to a value of 9 by addition of 15 wt percent aqueous HCl. Fumaryl chloride (0.23 g) is added by syringe. The mixture is reacted for 10

minutes. The pH is increased to a value of 12.5 by addition of 20 wt percent aqueous NaOH. Terminator solution (10 ml) is added all at once. Triphosgene solution (11 ml) is added over 2 minutes. The resulting mixture is reacted for 30 minutes. Triethylamine solution (30 ml) is added. NaOH solution (3ml 30 wt %) is added. The resulting mixture is reacted for another 10 min during
5 which time the pH is kept at 12.5 by addition of further 20 wt percent NaOH.

C. Polymer Purification: An emulsion of organic and aqueous phases obtained from the above synthesis is released into a 250 ml beaker, and then the liquid is filled into a 250 ml separating funnel. The lighter aqueous phase is removed by decantation. The heavier organic phase containing the polymer solution is filled back into the separating funnel and mixed
10 thoroughly with 100 ml 2 molar aqueous HCl. Next, the polymer phase is separated into a 250ml beaker. The aqueous phase is removed. The polymer is filled into a separating funnel and the HCl wash is repeated. Then, the polymer is washed four times with 100 ml deionized water, each time in a manner similar to the acid washes. The resulting pure polymer solution is filled into an aluminum pan, which is warmed on an electrical heating disk to remove dichloromethane by
15 evaporation. The resulting solid polymer, an unsaturated polycarbonate, is dried at 100°C and 10 mbar for 12 hours. The modified polycarbonate has the following properties: Mw, 27.5 g/mol (vs PS standards); PDI, 3.89; 10.5 mole percent (4 wt percent) fumaryl incorporated. Unsaturation level is 1.5 mole percent; Tg, 144°C.

Poly(ethylene oxide) A stirred mixture of 50.0 grams poly(ethylene glycol) (average Mn
20 380-420 g/mol), 8.82 grams dimethyl maleate and 10.3 grams isophthalic acid is added to a flask and flushed with nitrogen. The mixture is heated to 165 °C and 1500 ppm monobutyltin oxide catalyst is added. After 2 hours, the flask is placed under vacuum for 2 additional hours and cooled to yield an unsaturated poly(ethylene oxide) polymer. Tg = -54.3 °C. Mw = 7,570 g/mol, Mw/Mn = 4.33 (vs. polystyrene standards). Unsaturation level is 4.9 mole percent.

25 Analytical

In the foregoing characterizing disclosure and the example that follows, the following analytical techniques may be employed:

SAXS

Small angle x-ray scattering (SAXS) experiments are conducted at the Advanced Photon
30 Source (APS), DND-CAT, 5-ID-D beamline. The standard APS Undulator A was used as the x-ray source, with the x-ray energy set at 15 keV ($\lambda=0.82656\text{\AA}$). Two-dimensional scattering patterns are collected on a MARUSA, Inc. CCD camera with a collection data acquisition time set at 1 sec. Angular calibration of the detectors is achieved using silver behenate standards. The sample to detector distance is set at 531.9 cm. Two dimensional scattering patterns are reduced to one
35 dimensional data sets of scattering intensity versus scattering angle by radial integration of the 2-D

images, using a data visualization and analysis software package on the PV-WAVE platform.

Reduction and analysis of the one dimensional patterns is performed JADE™ analysis software.

DSC analysis is conducted on approximately 20mg of sample loaded into aluminum DSC pans.

Sample pans are sealed with an aluminum lid. DSC experiments are performed using a Linkam™

5 DSC cell. Samples are heated from 20 to 300 °C at 10 °C/minute, then cooled to 20 °C at a cooling rate of 10 °C/min. SAXS patterns are collected during the thermal cycle at 2 °C intervals.

CRYSTAF

Branching distributions are determined by crystallization analysis fractionation (CRYSTAF) using a CRYSTAF 200 unit commercially available from PolymerChar, Valencia,
10 Spain. The samples are dissolved in 1,2,4 trichlorobenzene at 160 °C (0.66 mg/mL) for 1 hr and stabilized at 95°C for 45 minutes. The sampling temperatures range from 95 to 30 °C at a cooling rate of 0.2 °C/min. An infrared detector is used to measure the polymer solution concentrations. The cumulative soluble concentration is measured as the polymer crystallizes while the temperature is decreased. The analytical derivative of the cumulative profile reflects the short chain branching
15 distribution of the polymer.

The CRYSTAF peak temperature and area are identified by the peak analysis module included in the CRYSTAF Software (Version 2001.b, PolymerChar, Valencia, Spain). The CRYSTAF peak finding routine identifies a peak temperature as a maximum in the dW/dT and the area between the largest positive inflections on either side of the identified peak in the derivative
20 curve. To calculate the CRYSTAF curve, the preferred processing parameters are with a temperature limit of 70 °C and with smoothing parameters above the temperature limit of 0.1, and below the temperature limit of 0.3.

DSC Standard Method

Differential Scanning Calorimetry results are determined using a TAI model Q1000 DSC
25 equipped with an RCS cooling accessory and an autosampler. A nitrogen purge gas flow of 50 ml/min is used. The sample is pressed into a thin film and melted in the press at about 175 °C and then air-cooled to room temperature (25 °C). 3-10 mg Of material is then cut into a 6 mm diameter disk, accurately weighed, placed in a light aluminum pan (ca 50 mg), and then crimped shut. The thermal behavior of the sample is investigated with the following temperature profile. The sample
30 is rapidly heated to 180 °C and held isothermal for 3 minutes in order to remove any previous thermal history. The sample is then cooled to -40 °C at 10°C/min cooling rate and held at -40 °C for 3 minutes. The sample is then heated to 150 °C at 10 °C/min. heating rate. The cooling and second heating curves are recorded.

The DSC melting peak is measured as the maximum in heat flow rate (W/g) with respect to the linear baseline drawn between -30 °C and end of melting. The heat of fusion is measured as the area under the melting curve between -30 °C and the end of melting using a linear baseline.

GPC

5 The gel permeation chromatographic system consists of either a Polymer Laboratories Model PL-210 or a Polymer Laboratories Model PL-220 instrument. The column and carousel compartments are operated at 140°C. Three Polymer Laboratories 10-micron Mixed-B columns are used. The solvent is 1,2,4 trichlorobenzene. The samples are prepared at a concentration of 0.1 grams of polymer in 50 milliliters of solvent containing 200 ppm of butylated hydroxytoluene
10 (BHT). Samples are prepared by agitating lightly for 2 hours at 160°C. The injection volume used is 100 microliters and the flow rate is 1.0 ml/minute.

Calibration of the GPC column set is performed with 21 narrow molecular weight distribution polystyrene standards with molecular weights ranging from 580 to 8,400,000, arranged in 6 "cocktail" mixtures with at least a decade of separation between individual molecular weights.
15 The standards are purchased from Polymer Laboratories (Shropshire, UK). The polystyrene standards are prepared at 0.025 grams in 50 milliliters of solvent for molecular weights equal to or greater than 1,000,000, and 0.05 grams in 50 milliliters of solvent for molecular weights less than 1,000,000. The polystyrene standards are dissolved at 80 °C with gentle agitation for 30 minutes. The narrow standards mixtures are run first and in order of decreasing highest molecular weight
20 component to minimize degradation. The polystyrene standard peak molecular weights are converted to polyethylene molecular weights using the following equation (as described in Williams and Ward, J. Polym. Sci., Polym. Let., 6, 621 (1968)): $M_{\text{polyethylene}} = 0.431(M_{\text{polystyrene}})$.

Polyethylene equivalent molecular weight calculations are performed using Viscotek TriSEC software Version 3.0.

25 Compression Set

Compression set is measured according to ASTM D 395. The sample is prepared by stacking 25.4 mm diameter round discs of 3.2 mm, 2.0 mm, and 0.25 mm thickness until a total thickness of 12.7 mm is reached. The discs are cut from 12.7 cm x 12.7 cm compression molded plaques molded with a hot press under the following conditions: zero pressure for 3 min at 190 °C,
30 followed by 86 MPa for 2 min at 190 °C, followed by cooling inside the press with cold running water at 86 MPa.

Density

Samples for density measurement are prepared according to ASTM D 1928. Measurements are made within one hour of sample pressing using ASTM D792, Method B.

Flexural/Secant Modulus/ Storage Modulus

Samples are compression molded using ASTM D 1928. Flexural and 2 percent secant moduli are measured according to ASTM D-790. Storage modulus is measured according to ASTM D 5026-01 or equivalent technique.

5 Optical properties

Films of 0.4 mm thickness are compression molded using a hot press (Carver Model #4095-4PR1001R). The pellets are placed between polytetrafluoroethylene sheets, heated at 190 °C at 55 psi (380 kPa) for 3 min, followed by 1.3 MPa for 3 min, and then 2.6 MPa for 3 min. The film is then cooled in the press with running cold water at 1.3 MPa for 1 min. The compression molded
10 films are used for optical measurements, tensile behavior, recovery, and stress relaxation.

Clarity is measured using BYK Gardner Haze-gard as specified in ASTM D 1746.

45° gloss is measured using BYK Gardner Glossmeter Microgloss 45° as specified in ASTM D-2457

Internal haze is measured using BYK Gardner Haze-gard based on ASTM D 1003

15 Procedure A. Mineral oil is applied to the film surface to remove surface scratches.

Mechanical Properties - Tensile, Hysteresis, and Tear

Stress-strain behavior in uniaxial tension is measured using ASTM D 1708 microtensile specimens. Samples are stretched with an Instron at 500 % min⁻¹ at 21 °C. Tensile strength and elongation at break are reported from an average of 5 specimens.

20 100% and 300% Hysteresis is determined from cyclic loading to 100% and 300% strains using ASTM D 1708 microtensile specimens with an InstronTM instrument. The sample is loaded and unloaded at 267 % min⁻¹ for 3 cycles at 21 °C. Cyclic experiments at 300% and 80 °C are conducted using an environmental chamber. In the 80 °C experiment, the sample is allowed to equilibrate for 45 minutes at the test temperature before testing. In the 21 °C, 300% strain cyclic
25 experiment, the retractive stress at 150% strain from the first unloading cycle is recorded. Percent recovery for all experiments are calculated from the first unloading cycle using the strain at which the load returned to the base line. The percent recovery is defined as:

$$\% \text{ Recovery} = \frac{\epsilon_f - \epsilon_s}{\epsilon_f} \times 100$$

30 where ϵ_f is the strain taken for cyclic loading and ϵ_s is the strain where the load returns to the baseline during the 1st unloading cycle.

Stress relaxation is measured at 50 percent strain and 37 °C for 12 hours using an InstronTM instrument equipped with an environmental chamber. The gauge geometry was 76 mm x 25 mm x 0.4 mm. After equilibrating at 37 °C for 45 min in the environmental chamber, the sample was

stretched to 50% strain at 333% min⁻¹. Stress was recorded as a function of time for 12 hours. The percent stress relaxation after 12 hours was calculated using the formula:

$$\% \text{ Stress Relaxation} = \frac{L_0 - L_{12}}{L_0} \times 100$$

where L_0 is the load at 50% strain at 0 time and L_{12} is the load at 50 percent strain after 12 hours.

5 Tensile notched tear experiments are carried out on samples having a density of 0.88 g/cc or less using an Instron™ instrument. The geometry consists of a gauge section of 76 mm x 13 mm x 0.4 mm with a 2 mm notch cut into the sample at half the specimen length. The sample is stretched at 508 mm min⁻¹ at 21 °C until it breaks. The tear energy is calculated as the area under the stress-elongation curve up to strain at maximum load. An average of at least 3 specimens are reported.

10 TMA

Thermal Mechanical Analysis (Penetration Temperature) is conducted on 30mm diameter x 3.3 mm thick, compression molded discs, formed at 180 °C and 10 MPa molding pressure for 5 minutes and then air quenched. The instrument used is a TMA 7, brand available from Perkin-Elmer. In the test, a probe with 1.5 mm radius tip (P/N N519-0416) is applied to the surface of the
15 sample disc with 1N force. The temperature is raised at 5 °C/min from 25 °C. The probe penetration distance is measured as a function of temperature. The experiment ends when the probe has penetrated 1 mm into the sample.

DMA

Dynamic Mechanical Analysis (DMA) is measured on compression molded disks formed in
20 a hot press at 180 °C at 10 MPa pressure for 5 minutes and then water cooled in the press at 90 °C / min. Testing is conducted using an ARES controlled strain rheometer (TA instruments) equipped with dual cantilever fixtures for torsion testing.

A 1.5mm plaque is pressed and cut in a bar of dimensions 32x12mm. The sample is clamped at both ends between fixtures separated by 10mm (grip separation ΔL) and subjected to
25 successive temperature steps from -100 °C to 200 °C (5 °C per step). At each temperature the torsion modulus G' is measured at an angular frequency of 10 rad/s, the strain amplitude being maintained between 0.1 percent and 4 percent to ensure that the torque is sufficient and that the measurement remains in the linear regime.

An initial static force of 10 g is maintained (auto-tension mode) to prevent slack in the
30 sample when thermal expansion occurs. As a consequence, the grip separation ΔL increases with the temperature, particularly above the melting or softening point of the polymer sample. The test stops at the maximum temperature or when the gap between the fixtures reaches 65 mm.

Melt Index

Melt index, or I_2 , is measured in accordance with ASTM D 1238, Condition 190 °C/2.16 kg. Melt index, or I_{10} is also measured in accordance with ASTM D 1238, Condition 190 °C/10 kg.

ATREF

5 Analytical temperature rising elution fractionation (ATREF) analysis is conducted according to the method described in USP 4,798,081. The composition to be analyzed is dissolved in trichlorobenzene and allowed to crystallize in a column containing an inert support (stainless steel shot) by slowly reducing the temperature to 20 °C at a cooling rate of 0.1 °C/min. The column is equipped with an infrared detector. An ATREF chromatogram curve is then generated by eluting
10 the crystallized polymer sample from the column by slowly increasing the temperature of the eluting solvent (trichlorobenzene) from 20 to 120 °C at a rate of 1.5 °C/min.

TREF

Large-scale TREF fractionation is carried by dissolving 15-20 g of polymer in 2 liters of 1,2,4-trichlorobenzene (TCB) by stirring for 4 hours at 160 °C. The polymer solution is forced by
15 15 psig (100 kPa) nitrogen onto a 3 inch by 4 foot (7.6 cm x 12 cm) steel column packed with a 60:40 (v:v) mix of 30-40 mesh (600-425 μ m) spherical, technical quality glass beads (available from Potters Industries, HC 30 Box 20, Brownwood, TX, 76801) and stainless steel, 0.028" (0.7mm) diameter cut wire shot (available from Pellets, Inc. 63 Industrial Drive, North Tonawanda, NY, 14120). The column is immersed in a thermally controlled oil jacket, set initially to 160 °C.
20 The column is first cooled ballistically to 125 °C, then slow cooled to 20 °C at 0.04 °C per minute and held for one hour. Fresh TCB is introduced at about 65 ml/min while the temperature is increased at 0.167 °C per minute.

Approximately 2000 ml portions of eluant from the preparative TREF column are collected in a 16 station, heated fraction collector. The polymer is concentrated in each fraction using a
25 rotary evaporator until about 50 to 100 ml of the polymer solution remains. The concentrated solutions are allowed to stand overnight before adding excess methanol, filtering, and rinsing (approx. 300-500 ml of methanol including the final rinse). The filtration step is performed on a 3 position vacuum assisted filtering station using 5.0 μ m polytetrafluoroethylene coated filter paper (available from Osmonics Inc., Cat# Z50WP04750). The filtrated fractions are dried overnight in a
30 vacuum oven at 60 °C and weighed on an analytical balance before further testing.

 13 C NMR Analysis

The samples are prepared by adding approximately 3g of a 50/50 mixture of tetrachloroethane- d_2 /orthodichlorobenzene to 0.4 g sample in a 10 mm NMR tube. The samples are dissolved and homogenized by heating the tube and its contents to 150 °C. The data is collected
35 using a JEOL Eclipse™ 400MHz spectrometer or a Varian Unity Plus™ 400MHz spectrometer,

corresponding to a ^{13}C resonance frequency of 100.5 MHz. The data is acquired using 4000 transients per data file with a 6 second pulse repetition delay. To achieve minimum signal-to-noise for quantitative analysis, multiple data files are added together. The spectral width is 25,000 Hz with a minimum file size of 32K data points. The samples are analyzed at 130 °C in a 10 mm broad
5 band probe. The comonomer incorporation is determined using Randall's triad method (Randall, James C.; JMS-Rev. Macromol. Chem. Phys., C29, 201-317 (1989)).

^1H NMR Analysis

Samples for Proton Nuclear Magnetic Resonance (^1H NMR) spectroscopy are prepared by adding approximately 3g of *d*-1,1,2,2-tetrachloroethane (TCE) to 0.4 g sample in a 10 mm NMR
10 tube. The samples are dissolved and homogenized by heating the tube and its contents to 120 °C. Complete dissolution requires about 15 minutes. Occasionally, heating the samples with a heat gun is required for thorough homogenization. The sample tubes are visually inspected to ensure complete dissolution of the polymer. Data are collected using a 300 MHz Varian INOVA Spectrometer. Thirty-two scans are collected at 120 °C. The proton chemical shifts are referenced
15 against a residual proton signal from the TCE solvent at 7.26 ppm.

FTIR

Fourier transform infrared spectroscopy (FTIR) is performed using a PerkinElmer Spectrum One spectrometer equipped with a Universal Attenuated Total Reflectance (ATR) Sampling Accessory. A background spectrum is obtained before each sample spectrum, and the crystal
20 surface sampling area is cleaned after each analysis. Each solid sample is pressed against the crystal (internal reflectance element), and data are collected using the following instrument parameters: 32 scans from 650 to 4000 cm^{-1} at 4 cm^{-1} resolution. The data are analyzed using Spectrum v5.0 software.

TEM

Samples for Transmission Electron Microscopy (TEM) are polished with a diamond knife
25 using a Leica UC6:FC6 cryo-ultramicrotome at -100°C and then stained with RuO_4 vapors for 3 hours at room temperature. Thin-sections of approximately 90nm thickness are collected at room temperature and examined with a JEOL JEM-1230 TEM running at an accelerating voltage of 120 kV. Images are recorded digitally using a Gatan Multiscan CCD camera, Model 749, and post
30 processed with Adobe Photoshop CS2.

Atomic Force Microscopy (AFM)

Sections are collected from the sample material using a Leica UCTTM microtome with a FC cryo-chamber operated at -80 °C. A diamond knife is used to section all sample material to a
35 thickness of 120 nm. Sections are placed on freshly cleaved mica surfaces, and mounted on standard AFM specimen metal support disks with a double carbon tape. The sections are examined

with a DI NanoScope IVTM Multi-Mode AFM, in tapping mode with phase detection. Nano-sensor tips are used in all experiments.

General Procedure: In the examples and comparative experiments that follow, unless otherwise noted, the reagent (i.e., starting polymers) are prepared as described hereinabove.

5 **Example 1**

A toluene solution containing 0.25 g each of a partially-hydrogenated polybutadiene (HPBD) and a partially-hydrogenated nitrile/butadiene rubber (HNBR) is warmed to 95 °C and stirred at that temperature until the polymers are completely dissolved. To this stirred solution are added 8 mg of Grubbs II metathesis catalyst. After 1 hour a product is precipitated from the cooled
10 solution by addition of methanol and recovered by filtration. Removing volatile components from the isolated solids under reduced pressure gives 0.45 g of recovered product. SAXS analysis of the recovered product shows phase separation of HPBD and HNBR polymer segments into microdomains, demonstrating the product is a cross-metathesized copolymer of HPBD and HNBR. A graph showing results at three temperatures is presented in Figure 1. The peak observed at 300°C
15 is evidence of an ordered microphase morphology present in the liquid phase of the cross-metathesized copolymer product.

Comparative Experiment A

Example 1 is repeated using HPBD and HNBR reagent polymers, with the exception that no metathesis catalyst is used. Analysis of the recovered product by SAXS shows it to be an isolated
20 blend of the original polymers due to the fact that HPBD crystalline lamellae scattering contributions are evident at all temperatures less than the T_m of the crystalline polymer within the range of 20 to 300 °C. A graph of the SAXS curve at three temperatures within the range of the test is shown in Figure 2. Failure to observe a peak at 300 °C indicates that the product of Comparative Experiment A shows no microphase order in the liquid phase, and thus the product of Comparative
25 Experiment A is consistent with a simple polymeric blend.

The SAXS results of Figures 1 and 2 indicate that block copolymers are prepared in the cross-metathesis reaction of Example 1, due to the fact that for the product of Example 1 scattering peaks for microphase separations of the incompatible polymer blocks, comprising chemically distinguishable polymer segments from the original unsaturated polymers, are observed at
30 temperatures above the T_m of the crystalline polymer phase, notably, in the scattering pattern at 300°C. In the comparative product of Figure 2, the characteristic crystal X-ray pattern of the unaltered crystalline polymer (HPBD) is apparent below the T_m, and no microphase separation scattering peaks are detectable, demonstrating that the product is merely a blend of the original polymers.

Example 2

A toluene solution containing 0.25 grams each of unsaturated poly(ethylene oxide) and 0.25 grams poly(ethylene-co-butadiene) is warmed to 105 °C and stirred at that temperature until the polymers are dissolved. To this stirred solution are added 9 milligrams of Grubbs II catalyst. After 1 hour, a polymer product is precipitated from the cooled solution by the addition of methanol and recovered by filtration. Removing volatile components from the isolated material under reduced pressure gives 0.47 grams of recovered polymer product. Tetrahydrofuran (30 ml) is added to the recovered product, which is placed on a shaker overnight to extract out non-metathesized unsaturated poly(ethylene oxide). The polymer remaining after extraction is filtered, dried, and analyzed by ¹H NMR spectroscopy as shown in Figure 3 (lower spectrum).

Comparative Experiment B

Example 2 is repeated, with the exception that no metathesis catalyst is used with the results shown in Figure 3 (upper spectrum). A comparison of the upper and lower spectra of Figure 3 indicates that poly(ethylene oxide) moieties are present in the polymer product of Example 2, but are absent in the product of Comparative Experiment B. These results provide evidence for formation of a block copolymer in Example 2 through metathesis segment interchange reactions, but the same does not occur in Comparative Experiment B.

Example 3

A toluene solution containing 0.25 g fumaryl-modified polycarbonate and 0.25 g poly(ethylene-co-octene-co-butadiene) is warmed to 105 °C and stirred at that temperature until the polymers are completely dissolved. To this stirred solution are added 9 mg of Grubbs II metathesis catalyst. After 1 hour, a polymer product is precipitated from the cooled solution by the addition of methanol, and the product is recovered by filtration. Removing volatile components under reduced pressure gives 0.47 g of polymer product. Analysis by TEM, as shown in Figure 4, indicates an ordered microphase morphology of the material. Figure 5 shows SAXS data at three temperatures. A peak at 300°C demonstrates microphase order in the liquid phase, as is also found in the non-liquid phases at 25°C and 100°C. The data indicate formation of a block copolymer through metathesis segment interchange reactions.

Example 4

A toluene solution containing 0.10 g poly(ethylene-co-butadiene) and 0.40 g poly(ethylene-co-octene-co-butadiene) is warmed to 105°C and stirred at that temperature until the polymers are completely dissolved. To this stirred solution are added 8,000 ppm tungsten hexachloride catalyst and 13,000 ppm tri-n-butylmethyltin co-catalyst. After 1 hour, a polymer product is precipitated from the cooled solution by the addition of methanol and recovered by filtration. Removing volatile components from the filtered product under reduced pressure gives 0.47 g of recovered polymer product, which is analyzed by crystallization fractionation (CRYSTAF) as seen in Figure 6.

Comparative Experiment C

Example 4 is repeated, with the exception that no metathesis catalyst is added. The product recovered is analyzed by CRYSTAF as seen in Figure 7. Significantly, in Figure 7 a peak is observed at 80°C, which is not observed in the CRYSTAF plot of Figure 6. The peak at 80°C is attributed to the presence of poly(ethylene-co-butadiene) polymer. The absence of a peak at 80°C for the product of Example 4 (Fig. 6) indicates that the solubility of this polymer product is increased as a result of metathesis segment interchange, thereby providing evidence for formation of a block copolymer. In contrast, the presence of a peak at 80 °C for the comparative product of Comparative Experiment C (Fig. 7) indicates that this product is a simple blend of non-metathesized crystalline polymer and poly(ethylene-co-octene-co-butadiene).

Example 5

A toluene solution containing 0.25 g each of poly(cyclooctadiene) and partially-hydrogenated poly(nitrile-butadiene) rubber is warmed to 50 °C and stirred at that temperature until the polymers are completely dissolved. To this stirred solution is added 8.02 mg of benzylidene[1,3-bis(2,4,6-trimethylphenyl)-2-imidazolidinylidene]dichloro (tricyclohexylphosphine)ruthenium. After one hour, the polymer product is precipitated from the cooled solution by the addition of methanol and recovered by filtration. Volatile components are removed from the isolated solids under reduced pressure, leaving 0.39 g of a solid thermoplastic product. Analysis by SAXS, DSC and NMR showed the presence of unsaturation but did not detect any crystalline polymer segments at a temperature above 30 °C in the metathesized copolymer product.

CLAIMS:

1. A process for preparing a cross-metathesized product mixture comprising contacting a metathesis catalyst under metathesis conditions with a composition comprising two or more chemically distinguishable ethylenically unsaturated polymers, at least one of said ethylenically unsaturated polymers (first polymer) having from 0.001 to 50 mole percent unsaturation and at least
5 one other of said ethylenically unsaturated polymers (second polymer) being an amorphous polymer having an expected Tg less than 0 °C and having from 0.001 to 5 mole percent unsaturation, to thereby form the cross-metathesized reaction product.
2. A process according to claim 1 wherein the first unsaturated polymer reagent comprises
10 from 10 to 50 mole percent ethylenic unsaturation.
3. A process according to claim 1 wherein the ethylenic carbon content of the first unsaturated polymer reagent is less than or equal to 40 weight percent.
4. A process according to any one of claims 1-3 wherein the first unsaturated polymer is a diene homopolymer or a copolymer of one or more olefins with a diene, or a partially hydrogenated
15 derivative thereof.
5. A process according to any one of claims 1-3 wherein the second unsaturated polymer is a copolymer of ethylene, one or more C₃₋₂₀ α-olefins, and a diene or alkyne, or partially hydrogenated derivatives thereof.
6. A process according to claim 4 wherein the second unsaturated polymer is a copolymer
20 of ethylene, one or more C₃₋₂₀ α-olefins, and a diene or alkyne, or a partially hydrogenated derivative thereof.
7. A process according to any one of claims 1-2 wherein the first unsaturated polymer is polybutadiene, polyisoprene, poly(2-chloro-1,3-butadiene), or poly(2-fluoro-1,3-butadiene) or a partially hydrogenated derivative thereof, and the second unsaturated polymer is a copolymer of
25 ethylene, one or more C₃₋₈ α-olefins, and butadiene.
8. A process according to claim 3 wherein the first unsaturated polymer is polyisoprene, poly(2-chloro-1,3-butadiene), or poly(2-fluoro-1,3-butadiene) or a partially hydrogenated derivative of polybutadiene, polyisoprene, poly(2-chloro-1,3-butadiene), or poly(2-fluoro-1,3-butadiene), and the second unsaturated polymer is a copolymer of ethylene, one or more C₃₋₈ α-olefins, and
30 butadiene.
9. A process according to claims 1 to 3 wherein the second unsaturated polymer is selected from the group consisting partially hydrogenated nitrile butadiene rubber, poly(ethylene oxide), unsaturated polycarbonate, and poly(ethylene-co-octene-co-butadiene).
10. A process according to claims 1-3 wherein the metathesis is conducted in the presence
35 of a catalyst comprising (A) at least one organometallic compound wherein the metal is selected

from Groups 1, 2, 12 or 13 of the Periodic Table of Elements, (B) at least one metal derivative wherein the metal is selected from the group consisting of metals of Groups 5, 6, or 7, and, optionally, (C) at least one chelating- or Lewis base- material.

11. A process according to claim 9 wherein the metathesis is conducted in the presence of a catalyst comprising (A) at least one organometallic compound wherein the metal is selected from Groups 1, 2, 12 or 13 of the Periodic Table of Elements, (B) at least one metal derivative wherein the metal is selected from the group consisting of metals of Groups 5, 6, or 7, preferably molybdenum or tungsten, and, optionally, (C) at least one chelating- or Lewis base- material.

12. A process according to any one of claims 1-3 wherein the metathesis is conducted in the presence of a catalyst comprising a compound of the general formula:

wherein:

M^{A} is ruthenium or osmium;

X^{A} and X^{B} are the same or different anionic ligand;

15 L^{A} is a neutral electron donor ligand;

L^{B} is a neutral electron donor ligand or a nitrogen containing heterocyclic carbene; and

R^{A} and R^{B} are independently each occurrence hydrogen, or an alkyl, alkenyl, alkynyl, aryl, carboxylate, alkoxy, alkenyloxy, alkynyloxy, aryloxy, alkoxycarbonyl, alkylthio, alkylsulfonyl, alkylsulfinyl, or silyl group of up to 20 atoms not counting hydrogen, an alkyl, alkoxy, aryl, aralkyl, haloalkyl, haloalkoxy, haloaryl or haloalkaryl substituted derivative thereof; or a functionalized derivative of any of the foregoing wherein the functional group is hydroxyl, thiol, alcohol, sulfonic acid, phosphine, thioether, ketone, aldehyde, ester, ether, amine, imine, amide, imide, imido, nitro, carboxylic acid, disulfide, carbonate, isocyanate, carbodiimide, carboalkoxy, carbamate, acetal, ketal, boronate, cyano, cyanohydrin, hydrazine, oxime, hydrazide, enamine, sulfone, sulfide, sulfenyl, or halogen.

13. A process according to claim 12 wherein the catalyst comprises a ruthenium derivative wherein L^{B} is a tertiary phosphine, and L^{A} is either a tertiary phosphine or a nitrogen containing heterocyclic ligand.

14. A process according to claim 13 wherein L^{A} is an imidazolidinyl- or triazolyl- ligand of the formula:

wherein Ar independently each occurrence is an aryl group of up to 50 atoms, and R^C independently each occurrence is hydrogen or an anionic ligand group or multiple R^C groups collectively may form one or more fused rings.

- 5 15. A process according to claim 14 wherein Ar independently each occurrence is phenyl or 2,4,6-trimethylphenyl.
16. A cross-metathesized reaction product preparable according to any one of claims 1-15.
17. A cross-metathesized reaction product preparable according to claim 16 wherein the expected Tg of the second polymer is less than -25 °C.
- 10 18. The cross-metathesized reaction product according to claim 16 or 17 wherein one polymer block comprises a partially hydrogenated polybutadiene and another polymer block comprises a partially hydrogenated butadiene nitrile rubber.
19. The cross-metathesized reaction product according to claim 16 or 17 wherein one polymer block comprises a poly(ethylene oxide) and another polymer block comprises a
- 15 20. The cross-metathesized reaction product according to claim 16 or 17 wherein one polymer block comprises a poly(ethylene-co-butadiene) and another polymer block comprises a poly(ethylene-co-octene-co-butadiene).
21. The cross-metathesized reaction product according to claim 16 or 17 wherein one
- 20 22. A partially hydrogenated derivative of a cross-metathesized reaction product of any one of claims 16 to 21.

- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- * & * document member of the same patent family

Date of the actual completion of the international search

1 February 2008

Date of mailing of the international search report

14/02/2008

Name and mailing address of the ISA/

European Patent Office, P.B. 5818 Patentlaan 2
NL - 2280 HV Rijswijk
Tel. (+31-70) 340-2040, Tx. 31 651 epo nl,
Fax: (+31-70) 340-3016

Authorized officer

Marsitzky, Dirk

INTERNATIONAL SEARCH REPORT

International application No

PCT/US2007/018624

C(Continuation). DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	O'GARA, PORTMESS, WAGENER: "Acyclic Diene Metathesis (ADMET) Polymerization. Synthesis of unsaturated Polythioethers" MACROMOLECULES, vol. 26, 1993, pages 2837-2841, XP002467200 page 2839; figure 4 -----	1-4, 10, 16
X	US 3 860 675 A (PAMPUS GOTTFRIED ET AL) 14 January 1975 (1975-01-14) cited in the application example 1 -----	1-7, 10, 11, 16, 17
X	DE 21 31 355 A1 (HUELS CHEMISCHE WERKE AG) 11 January 1973 (1973-01-11) cited in the application examples 1-9 -----	1-7, 10, 11, 16, 17
